

Rotary Seals

Your Partner for Sealing Technology

Trelleborg Sealing Solutions is a major international developer, manufacturer and supplier of seals, bearings and molded components in polymers. We are uniquely placed to offer dedicated design and development from our market-leading product and material portfolio: a one-stop-shop providing the best in elastomer, silicone, thermoplastic, PTFE and composite technologies for applications in aerospace, industrial and automotive industries.

With 50 years of experience, Trelleborg Sealing Solutions engineers support customers with design, prototyping, production, test and installation using state-of-the-art design tools. An international network of over 70 facilities worldwide includes over 20 manufacturing sites, strategically-positioned research and development centers, including materials and development laboratories and locations specializing in design and applications.

Developing and formulating materials in-house, we utilize the resource of our material database, including over 2,000

proprietary compounds and a range of unique products. Trelleborg Sealing Solutions fulfills challenging service requirements, supplying standard parts in volume or a single custom-manufactured component, through our integrated logistical support, which effectively delivers over 40,000 sealing products to customers worldwide.

Trelleborg Sealing Solutions facilities are certified according to current market-related quality standards. In addition to the established ISO 9001 standard, our facilities are certified to environmental, health and safety standards, as well as specific customer specifications. These certifications are in many cases prerequisites, allowing us to comply to all market segment requirements.

ISO 9001

The information in this brochure is intended to be for general reference purposes only and is not intended to be a specific recommendation for any individual application. The application limits for pressure, temperature, speed and media given are maximum values determined in laboratory conditions. In application, due to the interaction of operating parameters, maximum values may not be achieved. It is vital therefore, that customers satisfy themselves as to the suitability of product and material for each of their individual applications. Any reliance on information is therefore at the user's own risk. In no event will Trelleborg Sealing Solutions be liable for any loss, damage, claim or expense directly or indirectly arising or resulting from the use of any information provided in this brochure. While every effort is made to ensure the accuracy of information contained herewith, Trelleborg Sealing Solutions cannot warrant the accuracy or completeness of information.

To obtain the best recommendation for a specific application, please contact your local Trelleborg Sealing Solutions marketing company. This edition supersedes all previous brochures. This brochure or any part of it may not be reproduced without permission.

Company Profile

Welcome to Trelleborg Sealing Solutions

SEALING TECHNOLOGY

Trelleborg Sealing Solutions offers an outstandingly comprehensive sealing portfolio – a one-stop-shop providing the best in elastomer, silicone, thermoplastic, PTFE and composite technologies; solutions that feature in virtually every application conceivable within the aerospace, industrial and automotive industries.

A WORLDWIDE PRESENCE

We are uniquely placed to offer a dedicated design and development service for sealing solutions; globally servicing, supporting and supplying customers through an unrivaled international network.

COMMITMENT TO CUSTOMER, NEEDS LONG-TERM

Trelleborg Sealing Solutions is one of the world's foremost experts in polymer sealing technology. Using our expertise and experience, we facilitate customers in achieving cost-effective, durable solutions that match their specific business requirements.

Trelleborg Sealing Solutions -

Your Partner for Sealing Technology

Scan the QR-Code to watch the movie about our ability to add value and improve the business of our customers.

A world leader in engineered polymer solutions

THE TRELLEBORG GROUP

Trelleborg Coated Systems

Leading global supplier of unique customer solutions for polymer-coated fabrics deployed in a variety of industrial applications.

Trelleborg Industrial Solutions

Market leader in such industrial application areas as hose systems, industrial antivibration solutions and selected industrial sealing systems.

Trelleborg Offshore & Construction

Leading global supplier of polymer-based critical solutions for deployment in highly demanding environments.

Trelleborg Wheel Systems

Trelleborg Wheel Systems is a leading global supplier of tires and complete wheels for agricultural and forestry machines, materials handling and construction vehicles, and two-wheeled vehicles.

Trelleborg Sealing Solutions

One of the world's leading developers, manufacturers and suppliers of precision seals. It supports its aerospace, industrial and automotive customers through over 20 production facilities and more than 50 marketing companies globally.

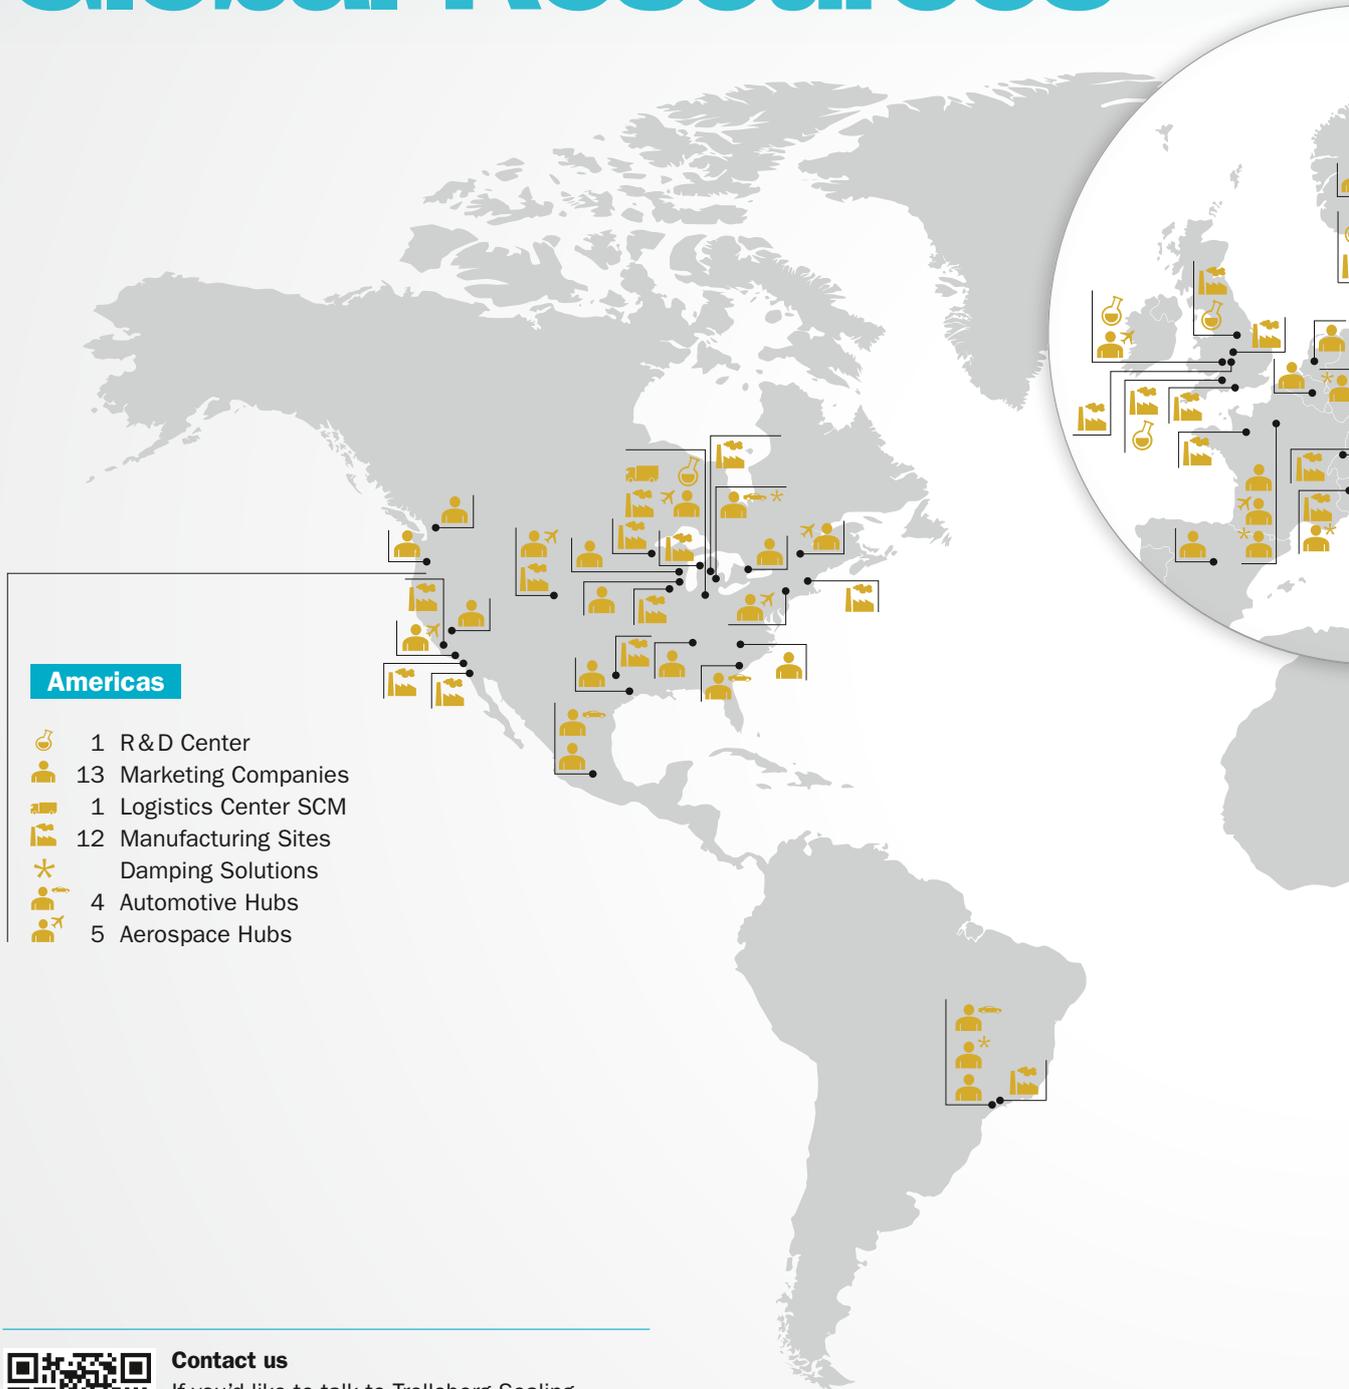

BLUE DIMENSION™

At Trelleborg we believe that the benefits of our solutions stretch beyond functionality and business performance.

Products, Brands & Materials

Decades of experience designing and manufacturing polymer solutions has led Trelleborg Sealing Solutions to develop, manufacture and supply a range of unique materials and proprietary product designs, many of which have become industry standards. Development is ongoing, ensuring that our solutions meet the changing needs of our customers, as well as the latest industry trends and regulations.

PRODUCTS

Fluid Sealing Systems

Static Seals

Bearings & Bushings

Rotary Seals

Medical Components

Pneumatic Seals

O-Rings

Engineered Molded Parts

Mechanical Face Seals (Heavy Duty Seals)

HiMod® FlatSeal™ Gaskets

Brake Shims, Tuned Absorbers, Rubore® seals

Assembly Units

Liquid Silicone Rubber (LSR)

Customized Aerospace Sealing

Tubing & Hose Sealing

WORLD RENOWNED NAMES UNITED

We own many of the longest established and leading names within the seal industry. These include:

- American Variseal
- Automated Dynamics
- Busak+Shamban
- Dowty Seals
- Chase Walton
- Forsheda
- GNL
- Impervia
- Nordex
- Orkot
- Palmer Chenard
- Polypac
- SSF
- SF Medical
- Shamban
- Silcofab
- Silcotech
- Sil-Pro
- Skega
- Stefa
- Wills

PROPRIETARY MATERIALS

Ongoing development has yielded some of the most successful sealing and bearing materials available:

- HiMod®
- HiPlast®
- Isolast®
- Orkot®
- Turcite®
- Turcon®
- Turel®
- Zurcon®

Films & Animations

SEEING IS BELIEVING

Complex sealing configurations can feature a large number of sealing elements. Trying to illustrate these on a 2-D page is difficult and can never properly show their function or characteristics. Trelleborg Sealing Solutions uses the latest graphic technologies to produce 3-D animations of applications and typical sealing solutions for them.

Simplify Your Business ServicePLUS

ServicePLUS aims at uniting various enhanced solutions across the entire value chain, simplifying the processes of engineering, logistics, manufacturing and aftermarket for the customer.

Engineering

Logistics

Manufacturing

Aftermarket

SPECIAL HANDLING

Special Handling bundles an assortment of individual packaging solutions together with additional services that optimize the mounting and handling of seals.

ADVANCED DELIVERY

Our Advanced Delivery services simplify your stock replenishment process by managing your different vendors and stock levels – be it through a Kanban system or complete C-Part Management.

ENGINEERING SUPPORT SERVICES

Trelleborg provides world-class expert support for your engineering needs, from extensive design & compound competence to leading edge product testing.

ASSEMBLY

Trelleborg is willing and able to offer pre-assembled parts put together by specially trained staff, delivered directly to you.

QUICKSEAL

QuickSeal covers your short-notice needs for sealing solutions, whether you require a prototype, functional sample or a small batch rapidly.

DIGITAL TOOLS

Online resources and apps developed to make an engineer's life easier.

Discover our wide range of digital tools at www.tss.trelleborg.com

simplify your business
with ServicePLUS:

Design Support & Engineering Tools

ONLINE TOOLS MAKE LIFE EASIER

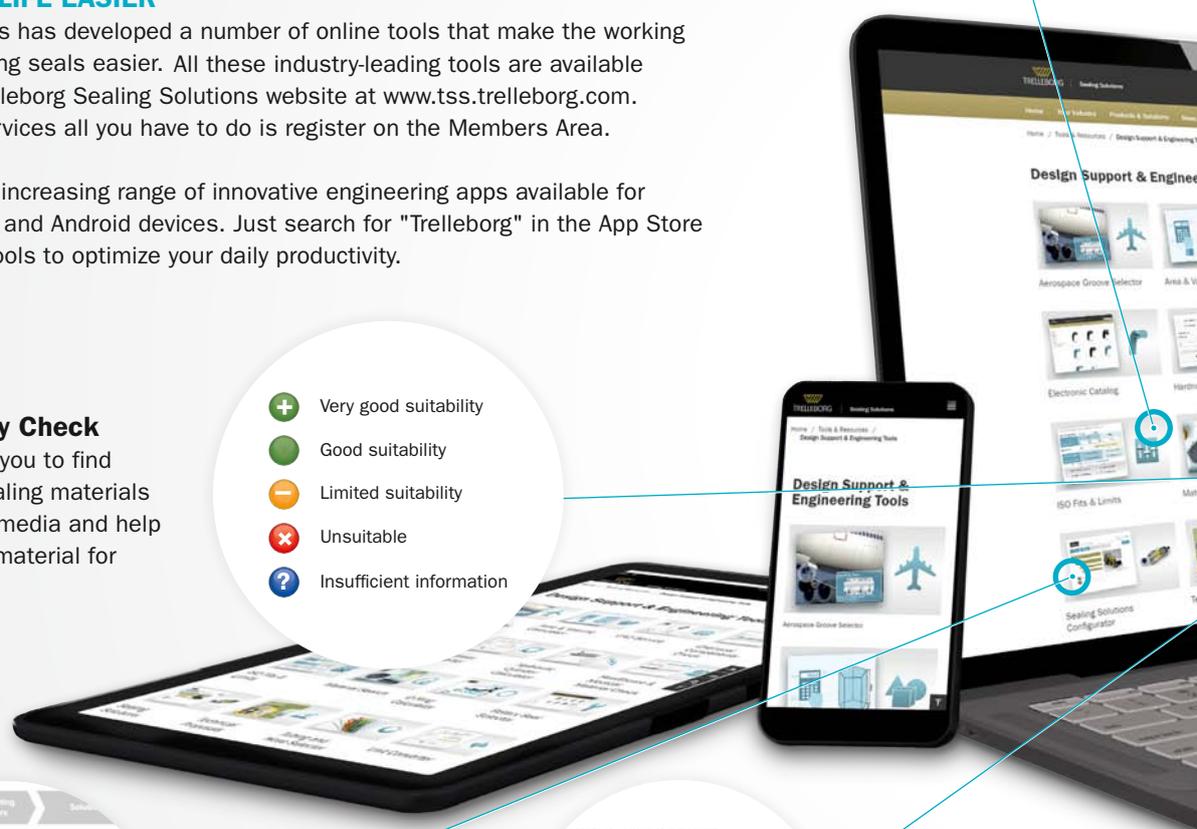

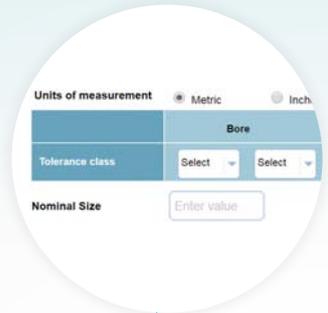

Trelleborg Sealing Solutions has developed a number of online tools that make the working life of an engineer specifying seals easier. All these industry-leading tools are available free-of-charge from the Trelleborg Sealing Solutions website at www.tss.trelleborg.com. To use these advanced services all you have to do is register on the Members Area.

There is also a continually increasing range of innovative engineering apps available for smartphones, both for iOS and Android devices. Just search for "Trelleborg" in the App Store or GooglePlay to find the tools to optimize your daily productivity.

Materials Search and Chemical Compatibility Check

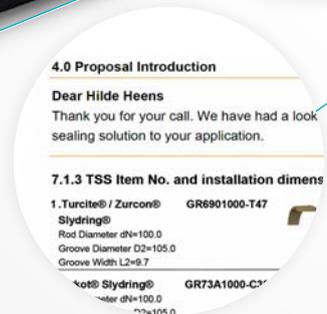

These two programs allow you to find out the compatibility of sealing materials with hundreds of different media and help identify the most suitable material for your application.

- + Very good suitability
- Good suitability
- Limited suitability
- ✗ Unsuitable
- ? Insufficient information

Sealing Solutions Configurator

The Sealing Solutions Configurator is the first tool of its kind offered by any seal supplier. It allows engineers to identify a proven sealing solution for their specific application in just four easy steps.

Technical Proposals Online

Enhance your communication with Trelleborg Sealing Solutions with the Technical Proposals Online tool. Instantly access all your proposed solutions anywhere at any time and benefit from quicker dialog with our sealing specialists.

ISO Fits & Tolerances

Our Fits & Tolerances Calculator allows you to easily determine type of fits using the tolerances according to DIN ISO 286. In addition, upon entering the nominal diameter the tool calculates lower and upper limit deviations plus the maximum and minimum interferences dependent on the selected tolerance classes for bore and shaft.

Versatile CAD Service

The CAD download functionality provides thousands of drawings of a wide range of seals. It gives the option of 2- or 3-dimensional files in a range of formats to suit most commonly used CAD systems.

Hydraulic System Calculator

Hydraulic System Calculator helps you design a solution around the cylinder which may involve motor, pump, orifice and pipe calculations. The application is in compliance with ISO 3320, ISO 3321 & ISO 4393.

Rotary Seal Selector

The Rotary Seal Selector allows you to search through the wide range of rotary seals and materials available based on application conditions and offers detailed information on installation and seal capabilities.

O-Ring Calculator

An industry-leading tool, the easy to use O-Ring calculator includes sizing capabilities, compression forces, design parameter recommendations and complete measurements. Results and comments may be printed, shared or filed as PDF.

Discover our design support and engineering tools at www.tss.trelleborg.com

Mobile Tools & Apps

We understand the needs of engineers on the go. Check out our latest mobile tools and apps, ranging from an O-Ring calculator to unit and hardness converters. Just search for "Trelleborg" in the App Store or Google Play to find the tools to optimize your daily productivity.

Discover our wide range of mobile tools and apps at www.tss.trelleborg.com

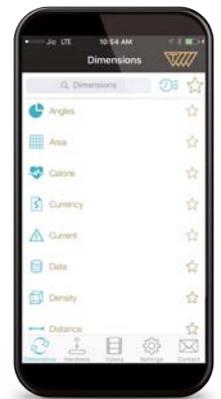

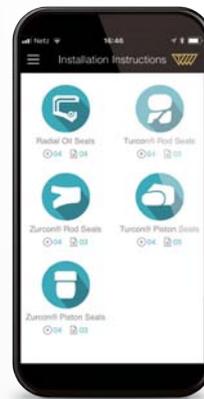

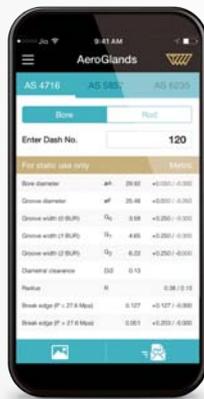

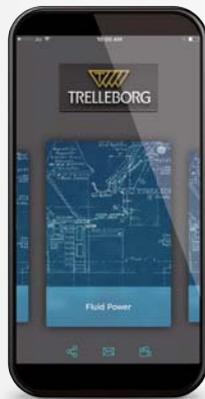

MANY MORE APPS available

Available on the APP STORE

Android App on Google Play

ISO Fits & Tolerances

Simply enter the nominal diameter and select the tolerance classes for bore and shaft to find the complete ISO fits definition with all relevant values including type of fit, with handy graphs to illustrate the classes by bore and shaft.

Mechanical Engineering Calculator

An excellent tool offers over 244 formulas in 16 categories, with more being added every update. Categories include the fields of mathematics, physics and mechanical engineering.

Aerospace Groove Selector

This app covers two of the most important SAE aerospace groove standards for hydraulic systems, AS4716 Rev B and AS5857 Rev A, making it really easy to find the size of grooves and hardware needed.

Installation Instructions

Videos demonstrate the best practice methods for installing seals, providing all relevant documentation within the interface, guiding you to a successful installation of Radial Oil Seals and Turcon® and Zurcon® rod and piston seals.

Unit & Hardness Converter

By simply selecting the dimension and entering the value for conversion, the app offers a wide range of engineering and scientific units for each dimension.

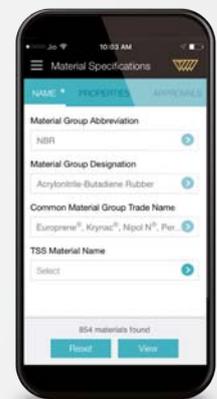

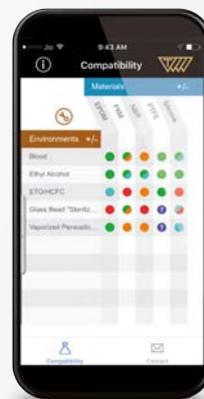

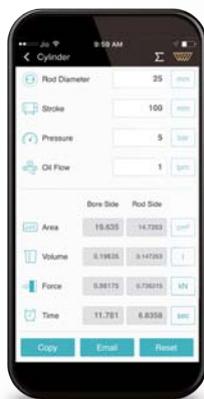

in the groove

Our *in the groove* magazine provides news, technical and product information on seals, as well as insights into the markets they are used in. The magazine is also available in print and as an interactive PDF.

Rotary Seal Selector

Bring the popular Rotary Seal Selector webtool with you! Quickly search through Trelleborg Sealing Solutions rotary seals and materials for the optimum product for your application conditions while on the move.

O-Ring Selector

When a user enters installation specifications into the O-Ring Selector app, such as the bore or rod/shaft diameter, the app quickly calculates O-Ring and housing dimensions in both metric and inch.

Hydraulic System Calculator

Hydraulic System Calculator helps you design a solution around the cylinder which may involve motor, pump, orifice and pipe calculations. The application is in compliance with ISO 3320, ISO 3321 & ISO 4393.

Area and Volume Calculator

Speeds up and simplifies calculating the area and volumes of more than 80 geometric shapes. The app supports both metric and imperial units and conveniently displays the formulas used. Fill your shape with solids or liquids, choosing from 1500 different materials, to calculate the weight.

Healthcare Materials

View a quick and easy overview of the compatibility of 34 materials with 35 chemical environments that are commonly encountered in the healthcare and medical industries. Select up to 20 materials and environments at once to produce a chart rating each material from "excellent" to "not recommended".

Sealing Materials Selector

Enter material specifications and required parameters, such as application temperature or hardness, to receive instant material proposals. The app features filters to limit searches based on chemical compatibility, institute approvals and product type and data sheets can be requested from within the interface.

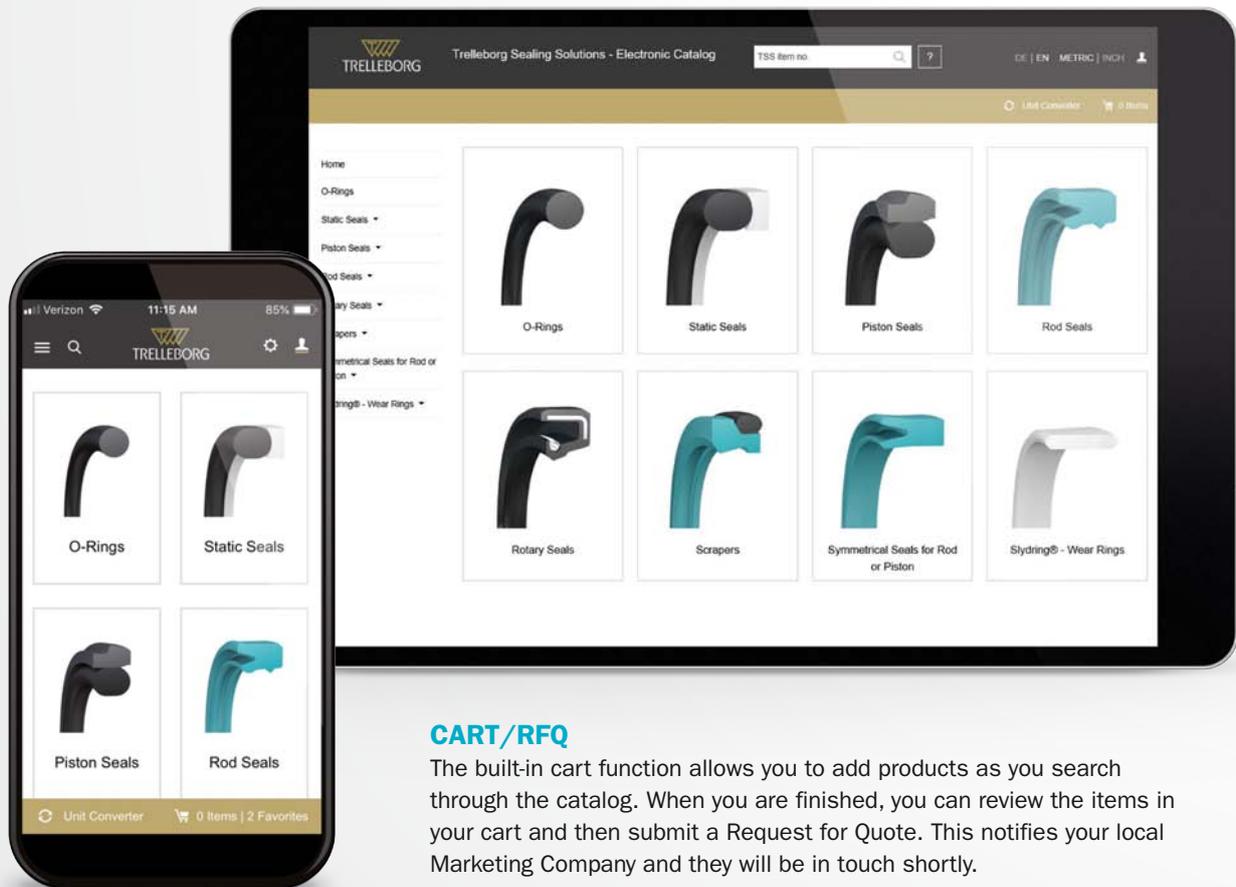

Electronic Catalog

Discover the Electronic Catalog online as an app or on our website

The Electronic Catalog is a user-friendly service that connects you to the broad range of products Trelleborg Sealing Solutions offers. The products are arranged based on product type and product group, making it easy to find the exact one you need.

Many functions are also included within the Electronic Catalog that allow you to understand product capabilities, compare similar seals, request a quote and much more. The Electronic Catalog is available from the Trelleborg Sealing Solutions website and in the App Store and GooglePlay for mobile use.

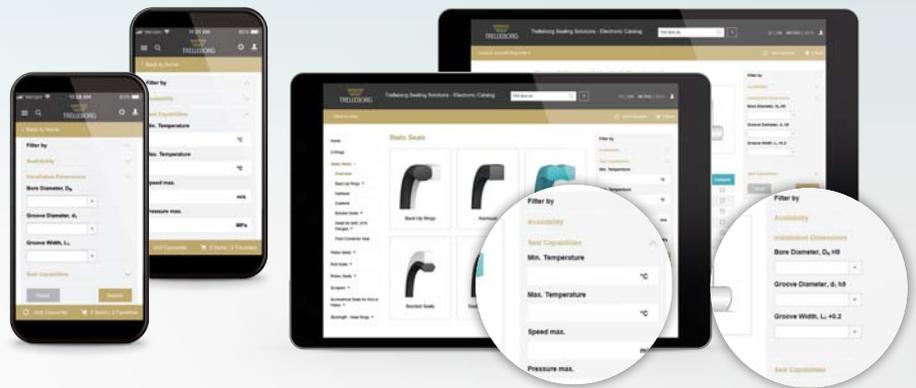

CART/RFQ

The built-in cart function allows you to add products as you search through the catalog. When you are finished, you can review the items in your cart and then submit a Request for Quote. This notifies your local Marketing Company and they will be in touch shortly.

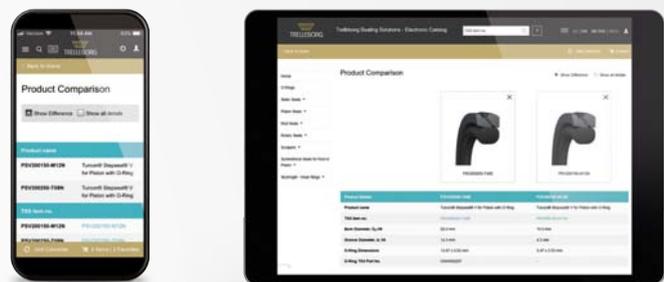

FILTERING

If you have specific operating conditions that the seal must meet and/or installation dimensions, the Electronic Catalog offers a filtering function within the product groups. Here you can input your temperatures, pressure, speed and various installation dimensions to filter products that can meet your needs.

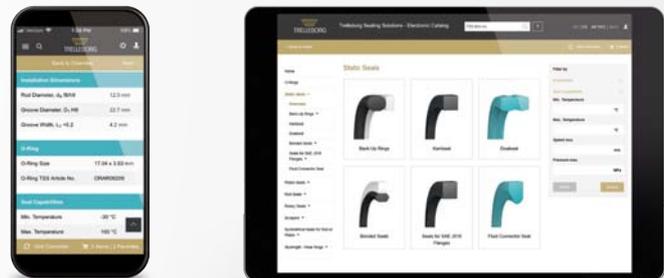

PRODUCT COMPARISON

When looking through the catalog, you can choose to compare multiple products. The product comparison function allows you to select which products you are interested in, and then puts all relevant information into a table for your review. You can even choose to display all product details side by side or to only show the fields where they differ.

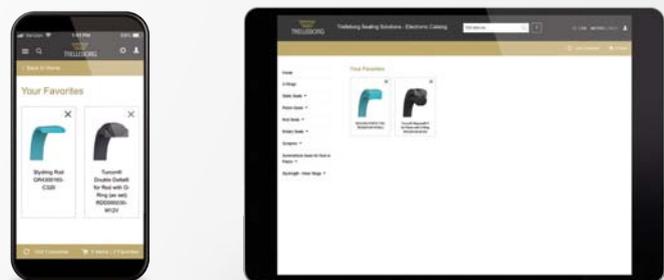

PRODUCT INFORMATION

Detailed product information is available for each part number. Once you select a specific part number, you will be able to see its installation dimensions, seal capabilities, related catalogs and other information. From this page, registered users can access the material data sheets that are applicable to the part number.

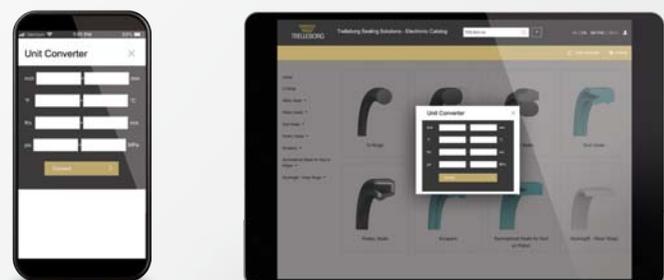

ADD TO FAVORITES

Do you have a part that you frequently look up or need information on? You can now save any of our part numbers as a favorite that is linked to your account. Anytime you log in to the Electronic Catalog, your favorites will be a click away!

UNIT CONVERTER

If you are looking at a product and need to know the conversion between metric and imperial, you can use the Unit Converter tool that is available at the top of the screen for web users and at the bottom for mobile.

Radial Oil Seal

■ Radial Oil Seal

■ General Seal Description

GENERAL

Radial Oil Seals, also known as rotary shaft lip seals, are round sealing devices used to seal between two machine parts that rotate relative to each other. They are used to seal lubrication in and/or contamination out, or to separate dissimilar media.

SEAL DESIGN

Although there are many styles of Radial Oil Seal, they all generally consist of a flexible rubber lip bonded to a rigid metal case. Most also contain a third element - a garter spring - fitted into the rubber lip to provide additional sealing force, both

initially and over the life of the seal. The total radial force of the sealing lip is a function of the rubber pre-tension, coupled with the tensile spring force. The sealing lip may be lathe cut or ready molded, and may feature molded-in hydrodynamic aids to assist sealing in demanding applications. The metal case may be exposed or have rubber molded around it for ease of assembly or improved static sealing.

Trelleborg Sealing Solutions offers state-of-the-art Radial Oil Seal design standards based on many years of experience in a wide range of application fields.

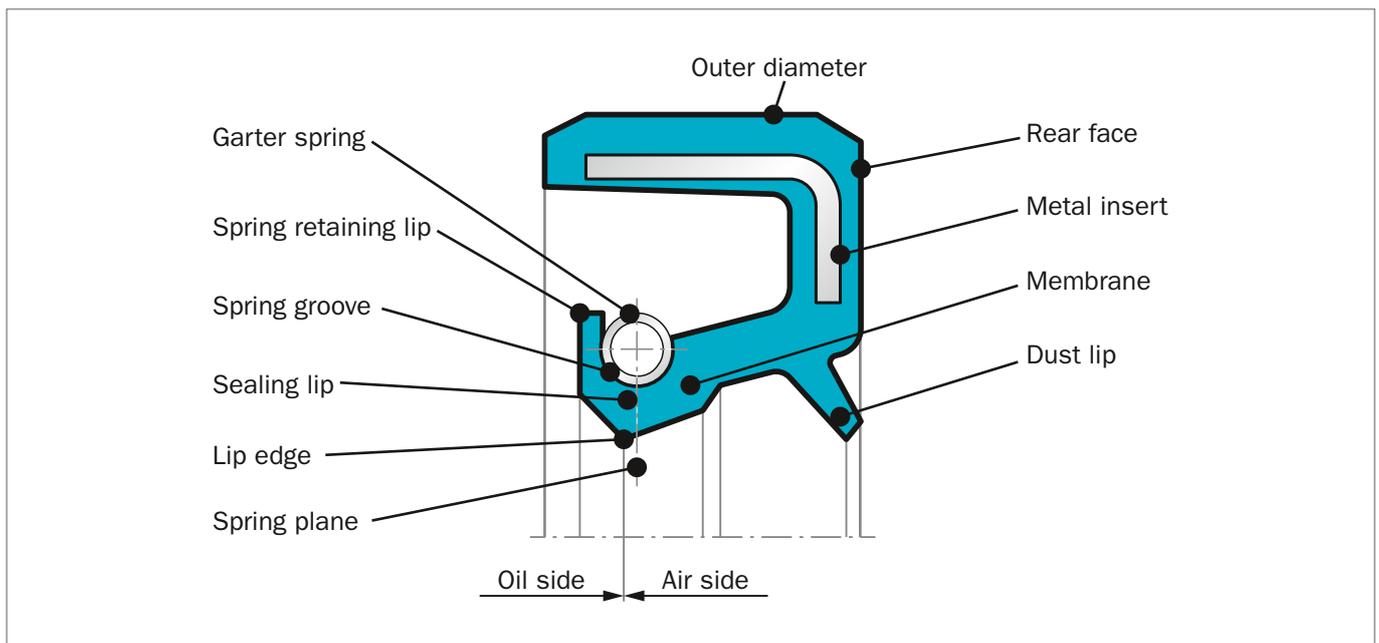

Figure 1: Designation for rotary shaft lip seals (extract from ISO 6194)

METAL CASE

The metal case is normally made out of formed, cold-rolled steel sheet in accordance with DIN EN 10139. Another material, such as stainless steel or brass may be used, depending on application requirements. If the metal case is rubber-covered, the outside diameter may be either smooth or ribbed. In all cases, the seal outer diameter tolerance is in accordance with ISO 6194-1 and the bore tolerance is in accordance with ISO H8.

Table 1: Outer Diameter Tolerances in Accordance with ISO 6194-1

Nominal Outside Diameter d_2	Diametral Tolerance	
	Metal Cased	Rubber Covered
$D_2 \leq 50$	+0.20	+0.30
	+0.08	+0.15
$50 < D_2 \leq 80$	+0.23	+0.35
	+0.09	+0.20
$80 < D_2 \leq 120$	+0.25	+0.35
	+0.10	+0.20
$120 < D_2 \leq 180$	+0.28	+0.45
	+0.12	+0.25
$180 < D_2 \leq 300$	+0.35	+0.45
	+0.15	+0.25
$300 < D_2 \leq 530$	+0.45	+0.55
	+0.20	+0.30

Note: Ribbed O.D tolerances on request.

GARTER SPRING

Function

When rubber is exposed to heat, pressure or chemical attack, it will gradually lose its original properties. The rubber is then said to have aged, causing the original radial force exerted by the sealing element to diminish. The function of the garter spring is to maintain the radial force during this period.

Experiments have shown that the radial force must vary with the size and type of seal. They have also clearly indicated the significance of maintaining the radial force within narrow limits during the service life of the seal. Extensive investigations in the laboratory have formed the basis for defining the radial force.

The garter spring is closely wound and carries an initial tension. The total force exerted by the spring consists of the force required to overcome the initial tension and the force due to the spring rate. The use of a garter spring with initial tension ensures that, as the sealing element wears, the total radial force from the initial tension will not change.

Material

Spring steel is normally used. If resistance to corrosion is required, stainless steel can be substituted. Garter springs of bronze or similar materials are not recommended, since they tend to fatigue after long service life, or as a result of exposure to high temperatures. In special cases, the garter spring can be protected against damage by means of a thin rubber cover.

■ Design Instructions: Shaft

SURFACE FINISH, HARDNESS AND MACHINING METHODS

The shaft design is vital for sealing performance and ensures maximum service life for the seal (see Figure 4). As a basic principle, the hardness of the shaft should be higher as peripheral speeds increase. DIN 3760 specifies that the shaft must be hardened to at least 45 HRC.

As the peripheral speeds increase, the hardness must be increased, and at 10 m/s a hardness of 60 HRC is required. The choice of a suitable hardness is dependent not only on the peripheral speed but also on such factors as lubrication and the presence of abrasive particles. Poor lubrication and difficult environmental conditions require a higher shaft hardness. DIN 3760 specifies a surface roughness of Ra 0.2 - Ra 0.8 μm . Laboratory tests have however proved that the most suitable roughness is $R_t = 2 \mu\text{m}$ ($R_a = 0.3 \mu\text{m}$). Both rougher and smoother surfaces generate higher friction, resulting in increased temperature and wear. Trelleborg Sealing Solutions suggest a surface roughness of Ra 0.2 - 0.5 μm .

Measurements of friction and temperature have also shown that grinding of the shaft is the best method of machining. However, spiral grinding marks may cause a pumping effect. Therefore, plunge grinding should be used, during which even ratios between grinding wheel speed and work-piece should be avoided. Polishing of the shaft surface with a polishing cloth produces a surface which causes higher friction and increases heat generated when compared with plunge grinding. In certain cases, it may be impossible to provide the necessary hardness, surface finish and corrosion resistance required for the shaft. This problem can be solved by fitting a separate sleeve onto the shaft. If wear should occur, only the sleeve needs to be replaced (see page 145 Shaft repair kit).

SHAFT RUN OUT

Shaft run out should as far as possible be avoided or kept to a minimum. At higher speeds, there is a risk that the inertia of the sealing lip prevents it from following the shaft movement. The seal must be located next to the bearing and the bearing play should be maintained at the minimum value possible (see Figure 2).

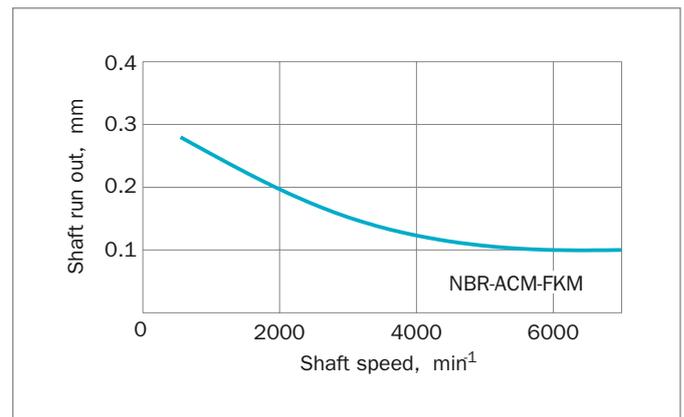

Figure 2: Shaft run out

ECCENTRICITY

Eccentricity between shaft and housing bore centers should be avoided in order to eliminate unilateral load of the lip (see Figure 3).

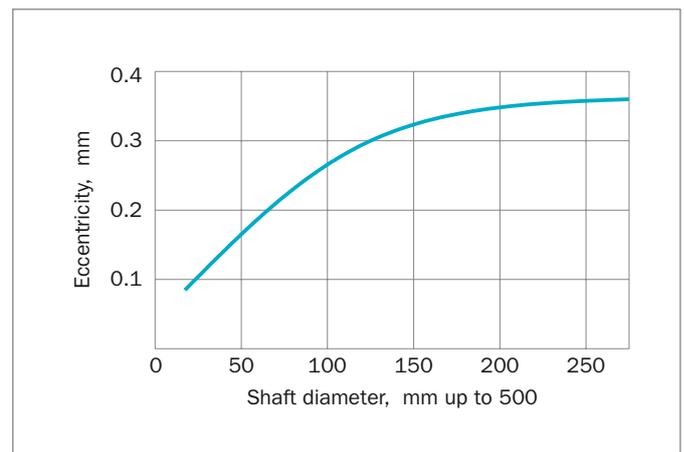

Figure 3: Eccentricity

■ Design Instructions: Housing Bore

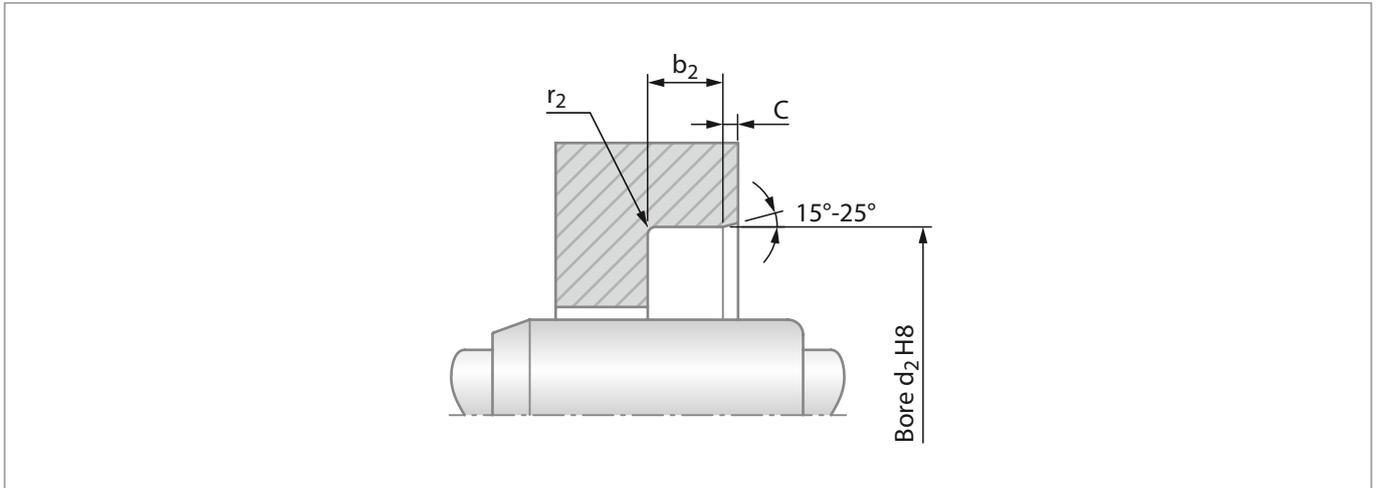

Figure 6: Installation depth and lead-in chamfer

HOUSING BORE

For metric sizes, the tolerances are in accordance with ISO 6194-1, which provides a suitable press fit for the bore tolerance in ISO H8. The inch sizes are in accordance with ARPM OS-4 cases where the housing bore has a different tolerance, the seal can be made to a suitable size. For bearing housings made of soft materials, e.g. light metals, and for bearing housings with thin walls, a special fit between the seal and the housing may be necessary. The tolerances for the seal and housing should then be determined by practical assembly trials. If a component such as a bearing is assembled through the housing bore for the seal, the bore may be damaged. In order to avoid damaging the bore, a seal with a larger outside diameter than that of the bearing should be selected.

Table 3: Housing Dimensions

Ring Width b	C mm	b ₂ (b + 0.3) mm	r ₂ max.
7	0.7 to 1.0	8.2	0.5
8	0.7 to 1.0	9.2	0.5
10	0.7 to 1.0	11.2	0.5
12	1.0 to 1.3	13.5	0.75
15	1.0 to 1.3	16.5	0.75
20	1.0 to 1.3	21.5	0.75

SURFACE ROUGHNESS OF THE HOUSING

Values for the surface roughness in the gland are specified in ISO 6194/1.

General values: Ra = 1.6 - 3.2 µm
 Rz = 6.3 - 12.5 µm

For metal-to-metal sealing or gas sealing, a good score-free and spiral-free surface finish is necessary. If the rotary shaft lip seal is bonded into the housing, ensure that no adhesive comes into contact with the sealing lip or the shaft.

SEALING ELEMENT

Compound

The material selected must take into account environmental conditions and function requirements.

Some of the requirements associated with environmental considerations are:

- Good chemical resistance
- Good resistance to heat and low temperature
- Good resistance to ozone and weathering

The functional demands include:

- High resistance to wear
- Low friction
- Low compression set
- Good elasticity

In addition, cost considerations render ease of processing a desirable feature. For the optimum material recommendation for your application, contact your local Trelleborg Sealing Solutions marketing company.

Type and Designations of Materials

Nitrile rubber	(NBR)
Acrylic rubber	(ACM)
Fluorinated rubber	(FKM)
Hydrogenated Nitrile rubber	(HNBR)

In order to satisfy the wide range of demands made on seals, Trelleborg Sealing Solutions has developed special unique compounds of each type of rubber. Other material compounds are also available to meet extreme requirements.

Table 4: Material Recommendations

Materials for Sealing Common Media		Material Designation			
		Acrylonitrile Butadiene Rubber NBR	Fluorocarbon Rubber FKM	Polyacrylate Rubber ACM	Hydrogenated Acrylonitrile Butadiene Rubber HNBR
		Material Abbreviation			
		N	V	A	H
		Max. Permissible Constant Temperature (°C)			
Mineral fluids	Engine oils	100	170	125	130
	Transmission oils	80	150	125	110
	Hypoid transmission oils	80	150	125	110
	ATF oils	100	170	125	130
	Hydraulic fluids (DIN 51524)	90	150	120	130
	Greases	90	-	-	100
Flame retardant hydraulic fluids (VDMA 24317) (VDMA 24320)	Oil-water emulsion	70	-	-	70
	Water-oil emulsion	70	-	-	70
	Aqueous solutions	70	-	-	70
	Water-free fluids	-	150	-	-
Other media	Fuel oils	90	-	-	100
	Water	90	100	-	100
	Lyes	90	100	-	100
	Air	100	200	150	130

Due to the different configurations of the media, the above-mentioned temperature ranges are for guidance only. Depending on the media, significant deviations may occur.

■ Description of Rubber Materials

NITRILE RUBBER (NBR)

Advantages:

- Good oil resistance
- Good heat resistance up to +100 °C in oil
- High tensile strength (special compounds over 20 MPa)
- High elongation at break
- Low swelling in water

Limitations:

- Poor weather and ozone resistance
- Poor resistance against polar fluids (ester, ether, ketones and aniline)
- Poor resistance against chlorinated hydrocarbons (carbon tetrachloride, trichlorethylene)
- Poor resistance against aromatic fluids (e.g. benzene, toluene)

Fluids, mineral oils and, above all, high-alloyed mineral oils (hypoid oils) containing larger quantities of aromatic hydrocarbons have a high swelling effect on NBR compounds. The swelling behavior can be improved by increasing the acrylonitrile content.

However an inferior cold flexibility and resistance to compression set must be accepted. The additives in high-alloyed oils can in certain cases cause an additional interaction between the elastomer and the additive, thus influencing the elasticity.

HYDROGENATED NITRILE RUBBER (HNBR)

Advantages:

- Good oil resistance, also in hypoid oils
- Good heat resistance, up to +150 °C
- Good mechanical properties
- Good weather and ozone resistance

Limitations:

- Poor resistance against polar fluids (esters, ethers, ketones and aniline)
- Poor resistance against chlorinated hydrocarbons (carbon tetrachloride, trichlorethylene)
- Poor resistance against aromatic fluids (benzene, toluene)

POLYACRYLIC RUBBER (ACM)

Advantages:

- Good resistance against oils and fuels (better than Nitrile rubber)
- Heat resistance about +50 °C better than for Nitrile rubber, +150 °C in oil and +125 °C in air
- Good weather and ozone resistance

Limitations:

- Not usable in contact with water and water solutions, even smaller quantities of water in oil
- Limited cold flexibility to about -20 °C, somewhat poorer than normal NBR
- Limited tensile strength and tear resistance, especially above +100 °C
- Poor wear resistance (considerably inferior compared to NBR)
- Poor resistance against polar and aromatic fluids and chlorinated hydrocarbons

FLUORINATED RUBBER (FKM)

Advantages:

- The resistance against oils and fuels is better than for any other rubber type
- The only highly elastic rubber material, which is resistant to aromatic and chlorinated hydrocarbons
- Excellent heat resistance, up to +200 °C
- Excellent weather and ozone resistance
- Excellent acid resistance (only inorganic acids, not suitable for organic acids e.g. acetic acid)

Limitations:

- Limited cold flexibility, to approximately +20 °C to -25 °C
- Limited tensile and tear strength, especially above +100 °C
- High compression set in hot water
- Poor resistance to polar solvents

FLUROSILICONE (FVMQ)

Advantages:

- Very low temperature flexibility down to -60 °C
- Excellent heat resistance, up to +230 °C
- Good compatibility with most mineral oils

Advantages:

- Expensive material
- Not suitable with polar fluids

FDA-COMPOUNDS

Trelleborg Sealing Solutions has engineered a set of compounds suitable to be used in rotary sealing applications like gearboxes, mixers and other equipment requiring a separation between lubricants and food or any external chemicals.

The elastomeric lip is energized by a spring and can be designed like any Radial Oil Seal in order to effectively work under pressure, with shaft eccentricities and vibrations, and with axial play.

Available types of compounds are updated according to state-of-the-art regulations like the FDA. Most available Radial Oil Seals are molded from EPDM and FKM polymers, bonded to stainless steel metal inserts and energized with special INOX springs. The engineering of these items is usually made according to customer specifications.

■ Working Parameters

TEMPERATURE RESISTANCE

Increasing temperature accelerates the aging of the rubber, the material becomes hard and brittle, the elongation decreases and the compression set increases. Axial cracks at the sealing edge are a typical indication that the seal has been exposed to excessively high temperature.

The aging of the rubber has appreciable significance on the useful life of the seal. The temperature limits for the principal materials are illustrated in Figure 7. They should only be regarded as approximate, since the materials are also affected by contact media. It can generally be said that a temperature increase of +10 °C (in air) will halve the theoretical useful life of the rubber.

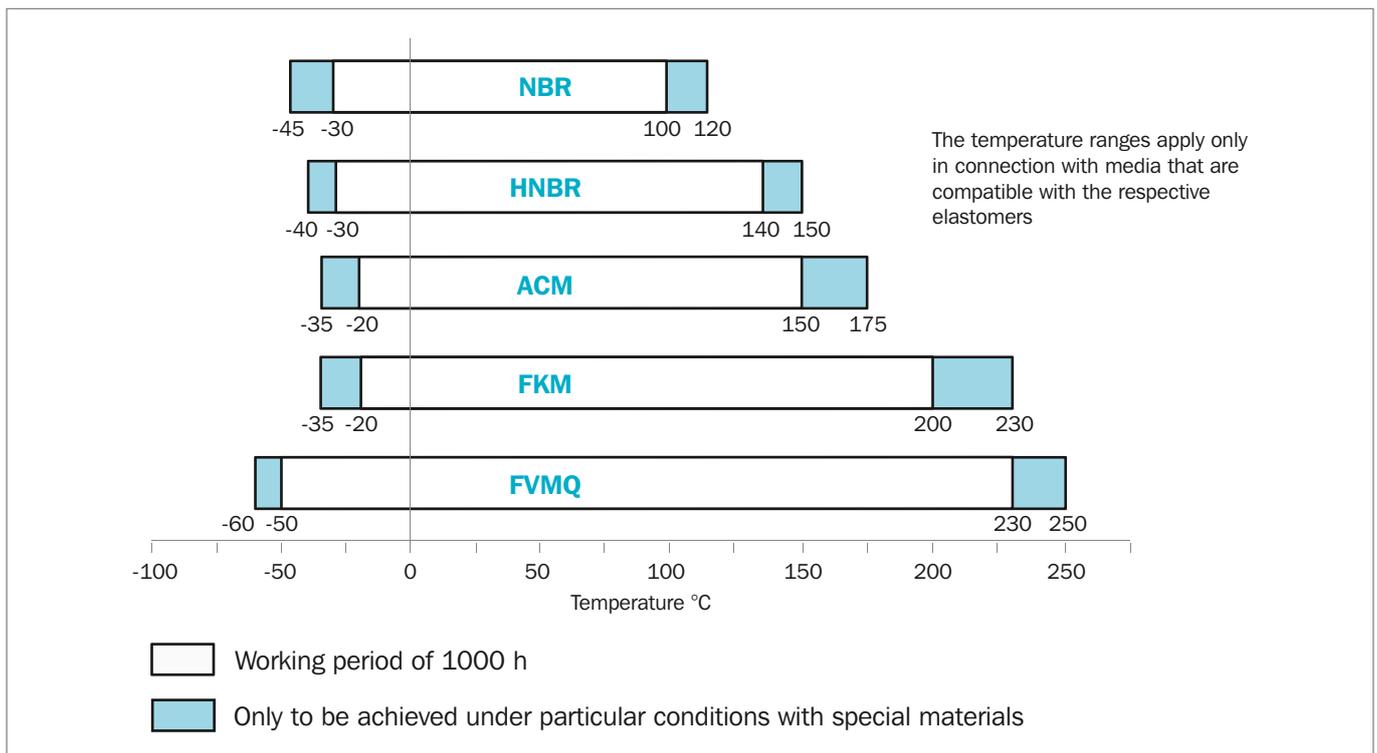

Figure 7: Temperature limits for some common types of rubber

TEMPERATURE

Temperature is the most critical criteria to be considered when selecting a rotary seal.

The temperature limits indicated in the selection tables are maximum operating temperatures of the sealing material in fluids to which the sealing material is compatible (good chemical resistance and controlled swelling/shrinkage).

The above descriptions show that the temperature in the sealing area is influenced by various parameters especially:

- The lubricating capability of the fluid and its ability to dissipate the heat generated under the sealing lip.
- The circumferential velocity
- The pressure applied

The resulting temperature in the sealing area must be considered to select the appropriate material. The initial temperature of the fluid can increase by up to 50% depending on operating parameters. For all applications, please refer to the recommendations in the various chapters or contact your local Trelleborg Sealing Solutions marketing company.

MEDIA

The media to be sealed heavily influences the choice of the seal and material type. Usually in rotary applications, liquid media are being contained. Pasty media generally restricts the use of rotary seals, especially with regards to circumferential velocity. Gaseous media require specially adapted seal designs.

Liquid media:

Most applications relate to lubricating fluids, but there are also those with hydraulic fluids based on mineral oils in accordance with DIN 51524 or ISO 6743, or fire-resistant and environmentally friendly hydraulic fluids. More rarely, very aggressive media with low lubricating capabilities must be sealed. Sealing of other fluids such as water or FDA compliant fluids require in many cases a special sealing solution and will not be covered in detail in this catalog. For specific requirements, please contact your local Trelleborg Sealing Solutions marketing company. The media is the first criteria to be considered when selecting the sealing material type. It will also influence the seal family and the profile.

The evaluation of the compatibility of the seal material with the media to be sealed is based on the analysis of the values of tensile strength, elongation, volume change and hardness change resulting from an immersion test. Please contact your local Trelleborg Sealing Solutions marketing company to select the optimum material for your application.

Mineral oils:

Mainly used in transmissions, elastomer materials have good compatibility with mineral oils within the recommended temperature range. Some mineral oils e.g. hypoid transmission oils contain special additives which produce more demanding operating conditions e.g. temperature range and/or high pressure. For these fields testing is recommended.

Synthetic oils:

For improvement of the viscosity, high temperature and/or service life, new oils with specific additives have been launched as partial or full synthetic oils. Elastomer sealing materials give the same good compatibility to synthetic mineral oils as they do to mineral oils. However, compatibility needs to be checked.

Grease:

Often used for roller and plain bearings, this media requires a specially adapted sealing solution. To reduce the risk of tilting and to allow the sealing lip to open under increasing pressure, the seal is installed in the reverse direction. Another important parameter to be considered is the maximum circumferential velocity. The maximum speed must be reduced to 50% of the permitted speed in oil, due to the poor heat exchange the grease can provide.

Above this limit, the change from grease to oil or installation of a seal with a PTFE-based lip (Turcon®) should be considered.

Poor lubricating media:

For poor lubricating media, an initial lubrication of the seal is required to avoid dry running. In such applications, we recommend a Radial Oil Seal with dust lip. The area between the lips will be used as a lubricant reservoir. Two seals in tandem Radial Oil Seal/Radial Oil Seal or Radial Oil Seal/GAMMA Seal will provide the same result.

Aggressive media:

Generally aggressive media (e.g. solvents) have poor lubricating properties and therefore we recommend Turcon® Varilip® or PDR seals. Turcon® and other PTFE materials solve the problem of chemical resistance and the metal cage can be produced out of various Stainless Steel materials to increase performance and product lifetime.

ENVIRONMENTALLY-FRIENDLY HYDRAULIC FLUIDS (BIO OILS)

When machines or process equipment are hydraulically operated, escaping hydraulic oil can pollute surface waters and the ground. One way of minimizing the danger posed by unwanted leakage, is the use of biologically degradable, non-toxic oils. In many countries, there are already statutory regulations and catalogs of requirements for dealing with materials that endanger water. Hydraulic and transmission fluids that protect the environment are already specified in some cases. Figure 8 shows types of biodegradable fluids.

Environmentally-friendly fluids have applications in all systems that operate in mobile and agricultural machinery and in the water and forestry industries, for example. In stationary systems, they are employed in plants where water is at risk, such as locks, water turbines and for foodstuffs and pharmaceutical products.

An important criterion for biologically rapidly-degradable fluids is their compatibility with seals. In Table 5, the resistance of elastomeric materials are given to "bio-oils".

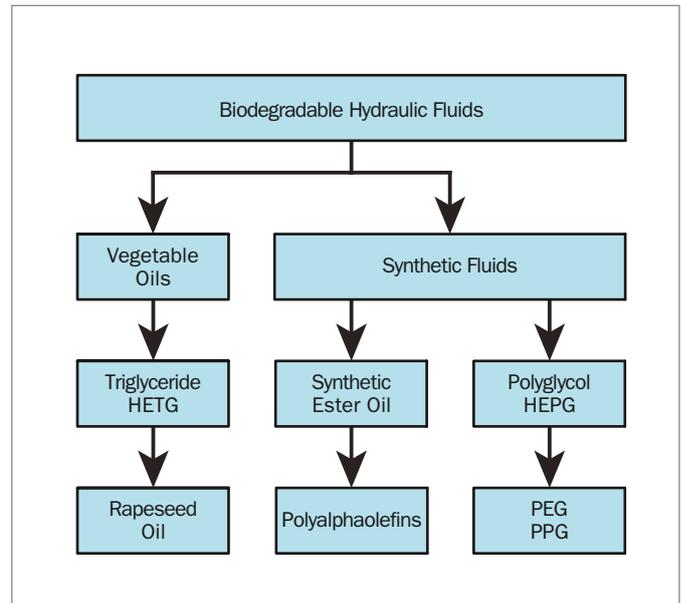

Figure 8: Biodegradable hydraulic fluids

OVERPRESSURE

When the sealing element is exposed to pressure, it is forced against the shaft and the area of the lip in contact with the shaft increases. The friction, as well as the generated heat, increases. As a result, when the seal is under pressure, the specified values of peripheral speed cannot be maintained but must be reduced in relation to the magnitude of the pressure. At high peripheral speeds even overpressures of 0.01 to 0.02 MPa may cause difficulties. By fitting a separate Back-up Ring, the types (TRA, TRC, TRB) can be used for overpressure above 0.05 MPa. The separate Back-up Ring shape follows the rear profile of the sealing element but without mutual contact when no pressure differential exists (see Figure 9). However, the Back-up Ring requires accurate fitting.

Please ask your local Trelleborg Sealing Solutions marketing company for suitable Back-up Ring drawings. Seal type TRU is formed to support the sealing element (see Figure 9). The type TRP/6CC is designed with a short and sturdy sealing lip, which allows overpressures without using a separate Back-up Ring. When a Back-up Ring is installed or when the types TRU, TRP/6CC are used, overpressures of 0.4 to 0.5 MPa are permissible at moderate peripheral speeds.

At very high pressures, seals with rubber-covered cases should be used to avoid leakage between the periphery of the seal and the housing bore. When the seal is under pressure there is a risk of axial movement in the housing bore (pop-out). This effect can be prevented by locating the seal against a shoulder, with a spacer ring or a circlip.

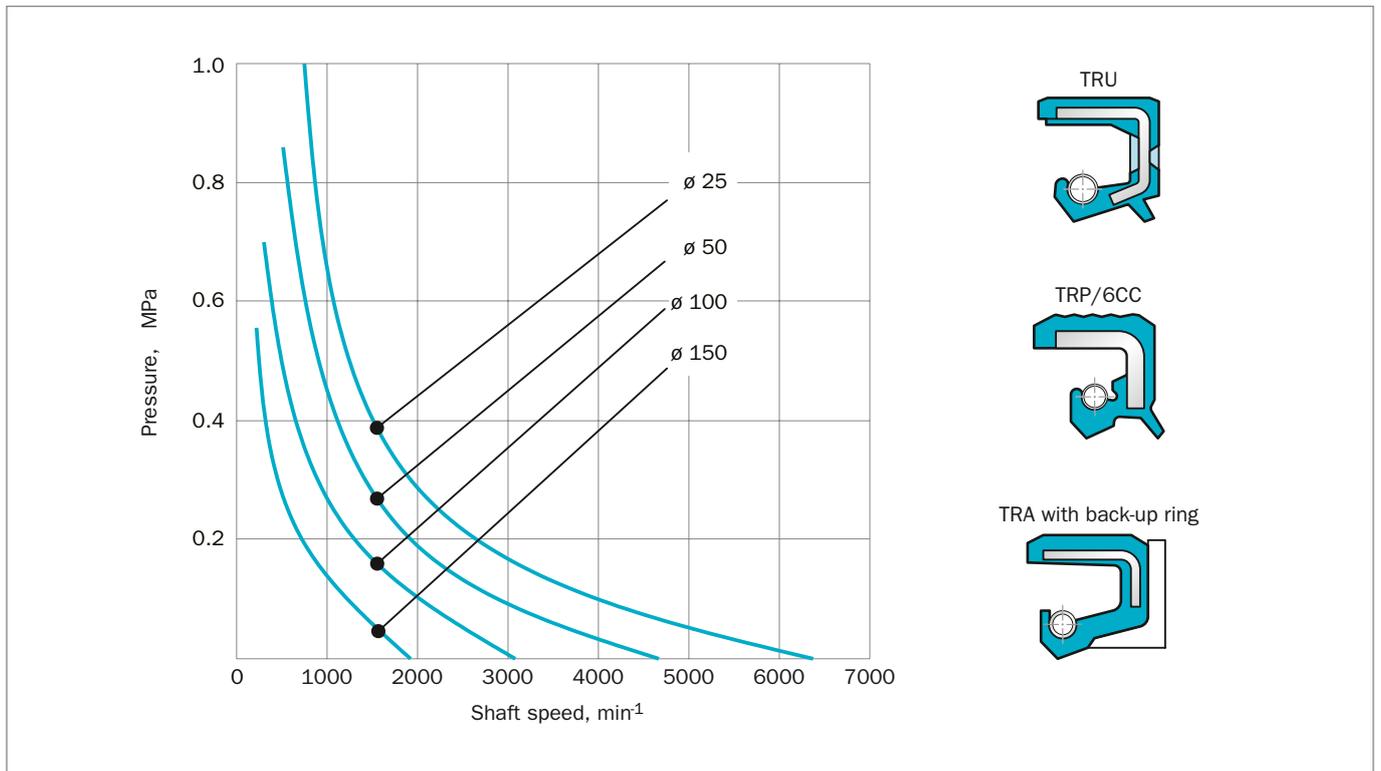

Figure 9: Permissible overpressure for supported lip seals and for pressure seals

PERIPHERAL SPEED AND NUMBER OF REVOLUTIONS

Different designs of the sealing element affect the magnitude of the friction and thus result in varying temperature rises. Various designs of the sealing element allow different maximum peripheral speeds. Figure 10 shows the approximate maximum values for the permissible peripheral speed for sealing elements (without dust lip), i.e. seal type TRC, TRA, TRB, etc, made with materials NBR or FKM, with no differential pressure, and where adequate lubrication or cooling of the sealing edge by the sealed media exists. In addition, the maximum permissible operating temperatures shown in Table 4 must not be exceeded. The curve shows that higher peripheral speeds are permissible for larger shaft diameters more than for the smaller. This is due to the fact that the cross-sectional area increases in proportion to the square of the diameter, thus increasing the heat dissipation capacity.

TRB, etc, made with materials NBR or FKM, with no differential pressure, and where adequate lubrication or cooling of the sealing edge by the sealed media exists. In addition, the maximum permissible operating temperatures shown in Table 4 must not be exceeded. The curve shows that higher peripheral speeds are permissible for larger shaft diameters more than for the smaller. This is due to the fact that the cross-sectional area increases in proportion to the square of the diameter, thus increasing the heat dissipation capacity.

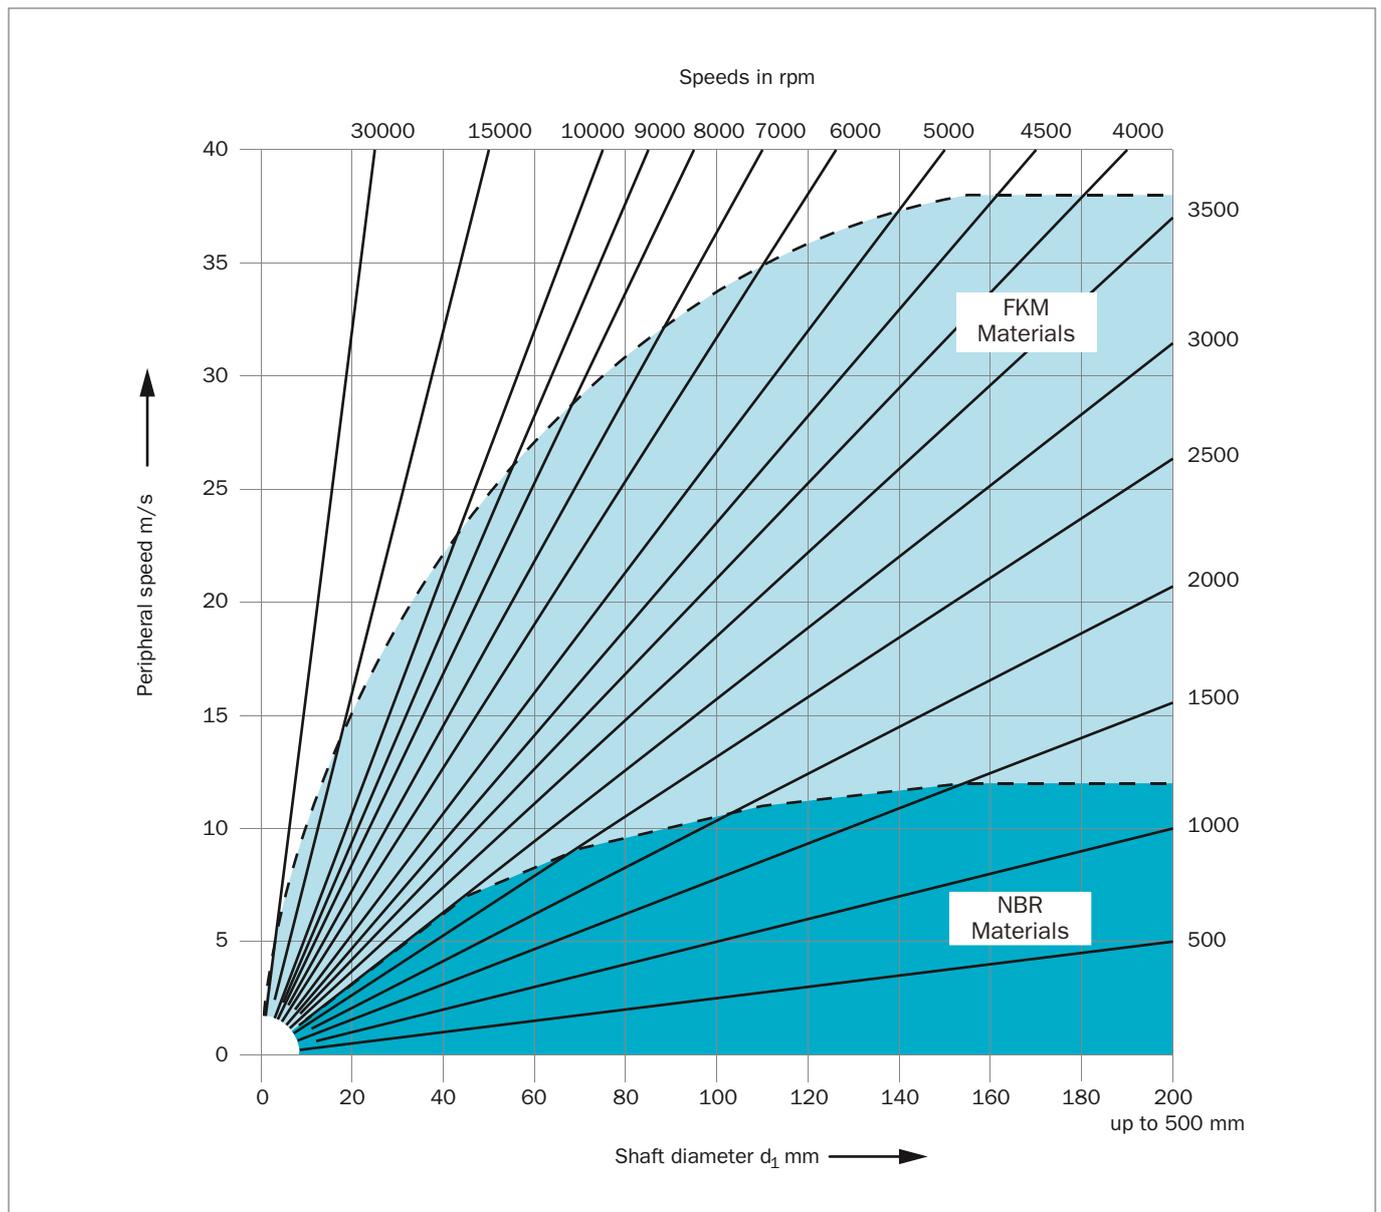

Figure 10: Permissible speeds in pressure-free state to DIN 3761

FRICTIONAL LOSS

The frictional loss is often of significant magnitude, particularly when low powers are transmitted. The frictional loss is affected by the following parameters: seal design and material, spring force, speed, temperature, medium, shaft design, and lubrication. Figure 11 shows the frictional losses in watts caused by a seal without dust lip when fitted in accordance with our technical instructions. In certain cases, the frictional loss can be reduced by a special design of the sealing lip, reduction of the spring force or by employing a special grade of rubber. Trelleborg Sealing Solutions engineering teams will be pleased to provide advice on such matters. It should be noted that the frictional loss during the running in period is greater than shown in the figure. The normal running in period is a few hours.

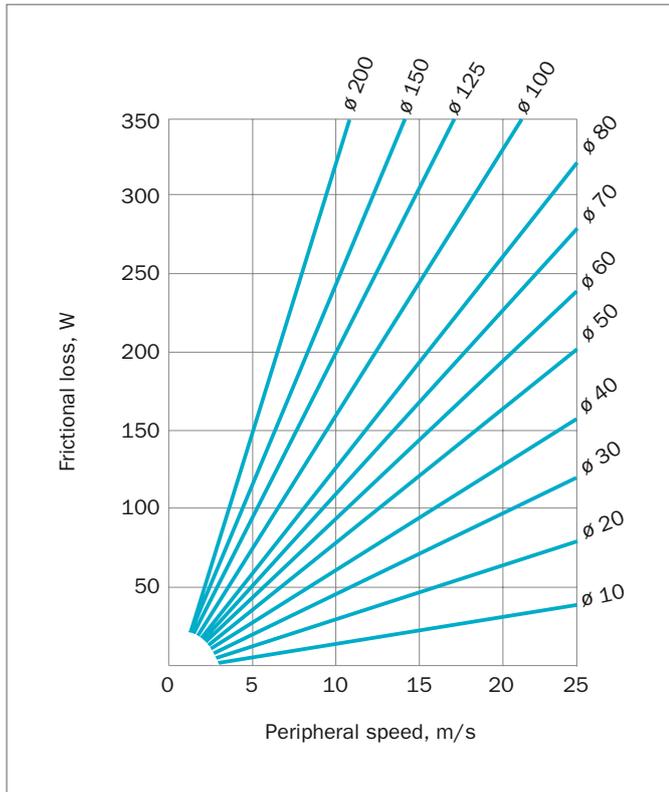

Figure 11: Frictional loss for TRA type seal of Nitrile rubber

LEAKAGE CONTROL

When defining leakage control, one must differentiate between static sealing (sealing of two surfaces without motion relative to one another) and dynamic sealing (relative motion between the two surfaces).

With a moving seal surface, a fluid film separates the sliding surfaces from one another forming a dynamic seal gap. Unlike in static sealing, the leakage path is not fully closed off, so small quantities may escape. Seals in which a dynamic seal gap forms between the seal body and a rotating shaft cannot be tight in the physical sense.

Absolute tightness in the physical sense cannot be achieved with a seal gap alone when sealing moving parts.

For many technical applications, however, it is quite adequate if the "leakage" is reduced to such an extent that there are no negative consequences for the environment or the operation of the assembly. This is called technical tightness.

Technical tightness must be specified by the user or manufacturer of an assembly, i.e. in some circumstances maximum permitted leakage rates must be defined.

For example, leakage classes are defined for oil seals in DIN 3761 Part II (Motor vehicles).

The German standard DIN 3761 classifies the tightness of lip seals into leakage classes 1 to 3. A so called zero-leakage is also defined. Zero-leakage means a function related film of moisture at the sealing edge to a non-drip formation of medium over the back-face of the seal. It is better to accept this "minimum leakage" rather than risking the lip to be damaged due to insufficient lubrication. The permissible leakage in class 1 to 3 is max 1 g to 3 g per seal for a test time of 240 hours.

■ Installation Instructions

The following points must be observed when installing rotary shaft lip seals:

- Before installing, clean the shaft and bore of debris or contamination
- Lubricate the shaft and seal inner diameter with a light coating of grease or oil
- Any sharp-edged transitions on the shaft or bore must either be chamfered or rounded
- When pressing the seal into the bore, take care that it does not deform
- The pressing force must be applied as close as possible to the outer circumference of the seal
- After installation, the seal must be concentric with the bore and at right angles to the shaft
- The end face of the mounting bore is generally used as a depth locator; the seal can also be fixed with a shoulder or a spacer washer.

Figure 12 shows various force fit situations of the rotary shaft lip seal, with suitable installation tools or devices.

IMPORTANT NOTE

The installation of Radial Oil Seals is covered in detail in the Trelleborg Sealing Solutions Installation Instructions app. Search for 'Trelleborg' in the App Store or Google Play to find and download it.

DISMANTLING AND REPLACEMENT

Dismantling of the seal can be accomplished using a screwdriver or similar tool. Take care not to damage the shaft or bore. The seal will be damaged during dismantling and should not be reused.

After repair or maintenance of a machine, a new rotary shaft lip seal must always be installed, even if the old one seems to be still usable. The sealing edge of the new seal should not ride on the same contact area on the shaft as the old seal. This can be achieved by:

- Replacement of shaft sleeves
- Fitting the seal into the bore to a different depth
- Reworking of the shaft and assembling a wear sleeve (see page 145 Shaft repair kit)

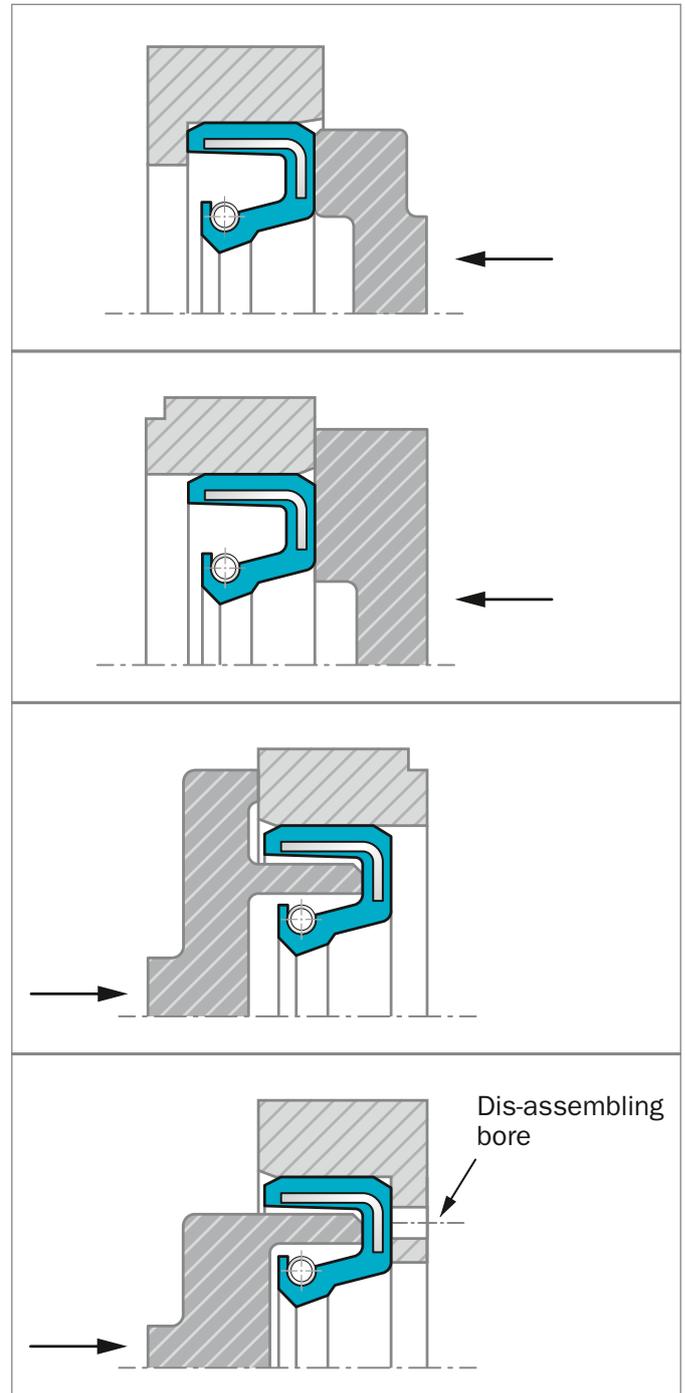

Figure 12: Installation aids for fitting rotary shaft lip seals

■ Standard Radial Oil Seal

Standard elastomeric rotary shaft seals are designed according to DIN 3760 (3761) and ISO 6194/1 recommendations. Types DIN A and DIN AS may have a **wavy or flat outer sheath**.

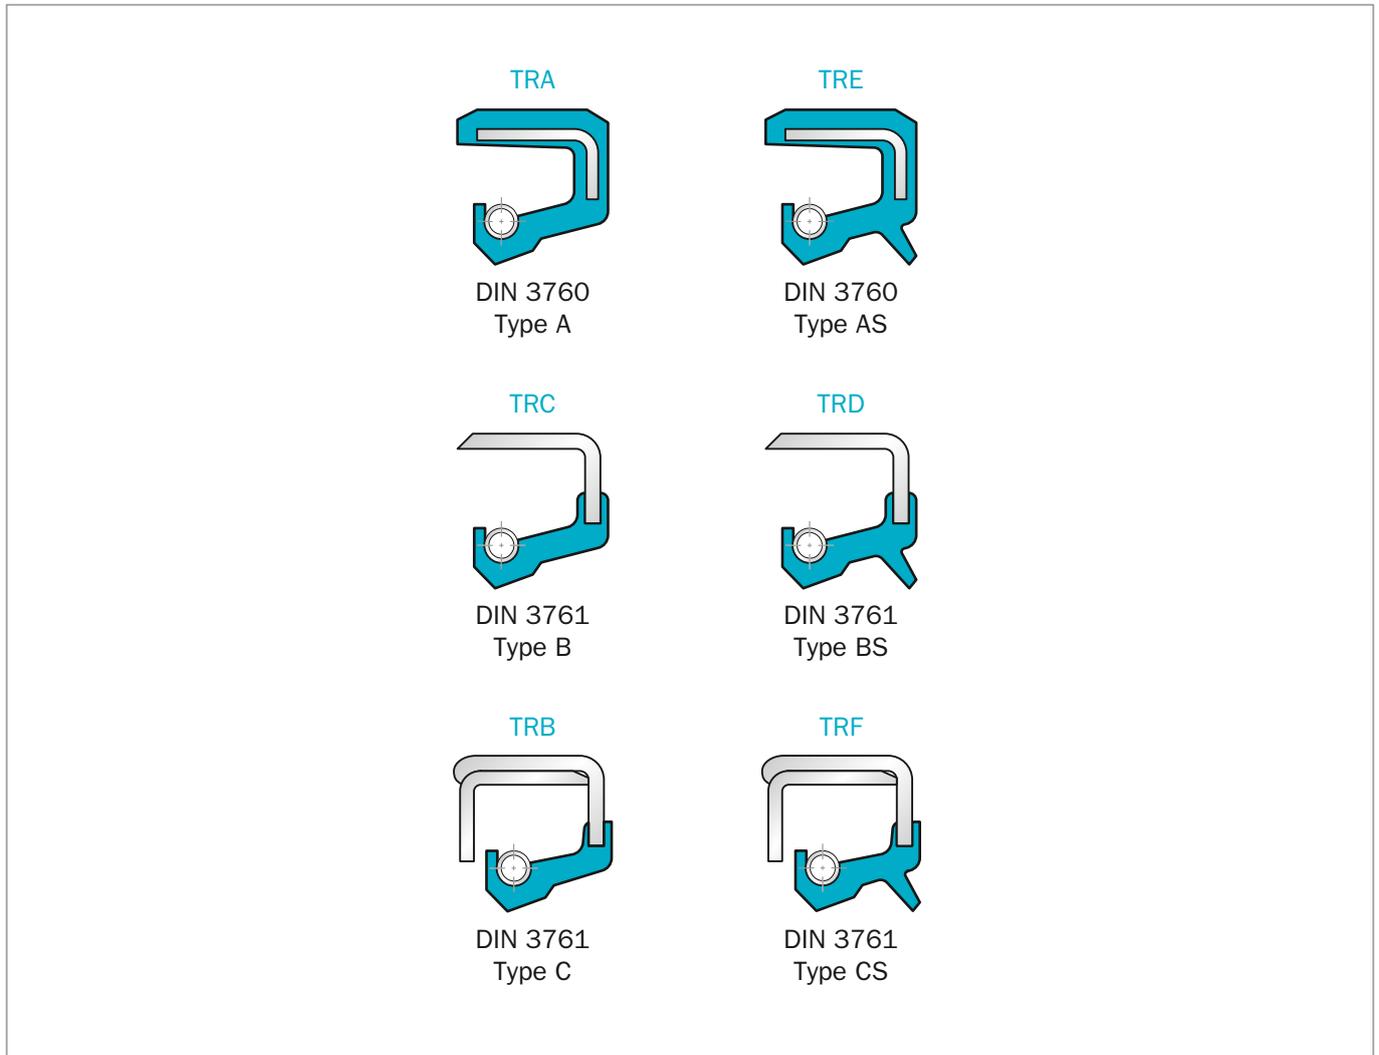

Figure 13: Standard types

■ Type TRA

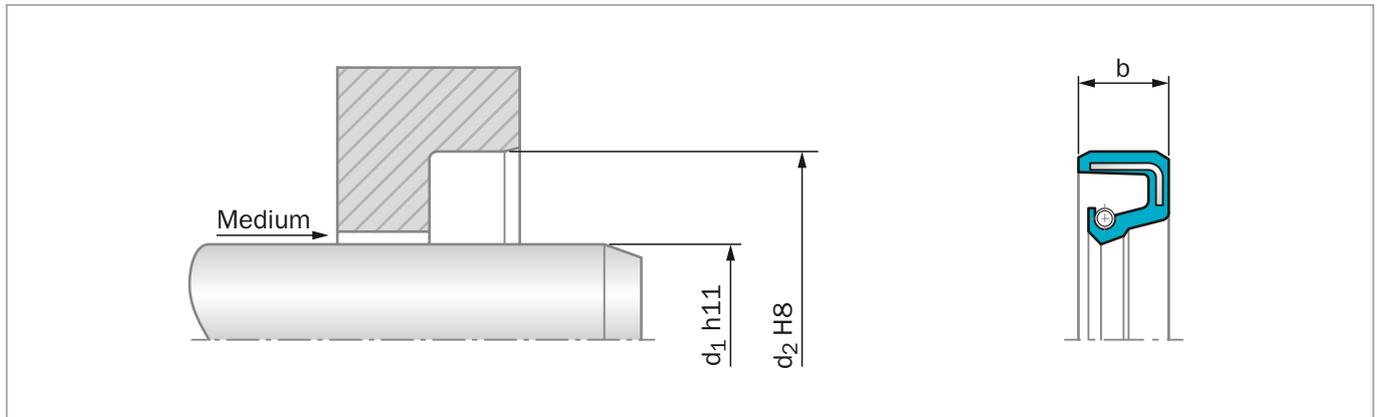

Figure 14: Installation Drawing

GENERAL DESCRIPTION

Trelleborg Sealing Solutions type TRA are seals with completely rubber covered outer diameter. Two different O.D design are available: Flat rubber sheath and wavy.

This type is not recommended for use in heavily polluted environments.

ADVANTAGES

- Good static sealing
- Compensation of different thermal expansion
- Reduced risk of fretting corrosion
- Higher bore surface roughness is allowed
- Installation in split-housings
- Modern lip design provides low radial forces

APPLICATION EXAMPLES

- Transmission systems (e.g. gearboxes)
- Pumps
- Electrical motors
- Machine tools

OPERATING CONDITIONS

Pressure:	Up to 0.05 MPa
Temperature:	-40 °C to +200 °C (depending on material)
Speed:	Up to 10 m/s (depending on material)
Media:	Mineral and synthetic lubricants (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousand compatibility tests. Please ask your local Trelleborg Sealing Solutions marketing company for details.

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure and temperature.

Table 6: Materials

Table 8: Materials

TSS Compound Reference	Standard Compound	Temperature °C	Standard Metal Insert	Standard Spring
N7MMR	NBR (70 Shore A)	-30 °C - 100 °C	Carbon steel	Carbon steel
4N011/4NV11	NBR (75 Shore A)	-30 °C - 100 °C	Carbon steel	Carbon steel
VCBVR	FKM (70 Shore A)	-20 °C - 200 °C	Carbon steel	Stainless steel
4V012	FKM (75 Shore A)	-20 °C - 200 °C	Carbon steel	Stainless steel

Special grades and other materials (ACM, EACM, EPDM, HNBR, VMQ) on request.
Metal insert, and spring as well, can be supplied in different materials on request.

■ Type TRC

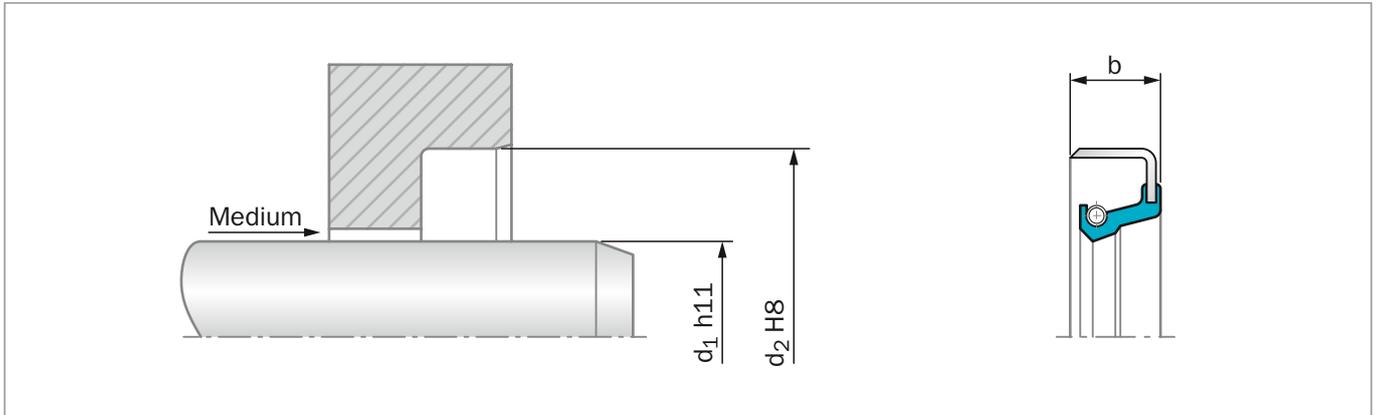

Figure 16: Installation Drawing

GENERAL DESCRIPTION

Trelleborg Sealing Solutions Type TRC are metal cased radial lip seals. This type is not recommended for use in heavily polluted environments. As the static sealing between housing and metallic shell is limited, low viscosity media can "creep". Better performance can be achieved with Epoxy-based resin O.D. coating. This special treatment is on request.

ADVANTAGES

- Good radial stiffness, especially for large diameters
- Good fitting stability avoiding pop-out of the seal
- Modern lip design provides low radial forces
- Cost effective
- Suitable for use in combination with axial seal (V-Ring and GAMMA-seal)

APPLICATION EXAMPLES

- Transmission systems (e.g. gearboxes)
- Pumps
- Electrical motors
- Machine tools
- Heavy engineering applications

OPERATING CONDITIONS

Pressure:	Up to 0.05 MPa
Temperature:	-40 °C to +200 °C (depending on material)
Speed:	Up to 10 m/s (depending on material)
Media:	Mineral and synthetic lubricants (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousand compatibility tests. Please ask your local Trelleborg Sealing Solutions marketing company for details.

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure and temperature.

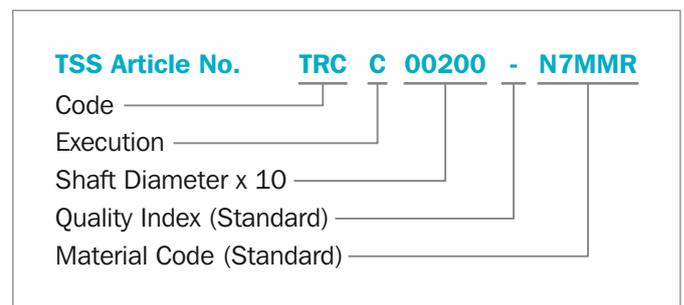

**Table 10: Materials**

TSS Compound Reference	Standard Compound	Temperature °C	Standard Metal Insert	Standard Spring
N7MMR	NBR (70 Shore A)	-30 °C - 100 °C	Carbon steel	Carbon steel
4N011/4NV11	NBR (75 Shore A)	-30 °C - 100 °C	Carbon steel	Carbon steel
VCBVR	FKM (70 Shore A)	-20 °C - 200 °C	Carbon steel	Stainless steel
4V012	FKM (75 Shore A)	-20 °C - 200 °C	Carbon steel	Stainless steel

Special grades and other materials (ACM, EACM, EPDM, HNBR, VMQ) on request.
Metal insert, and spring can be supplied in different materials on request.

■ Type TRD

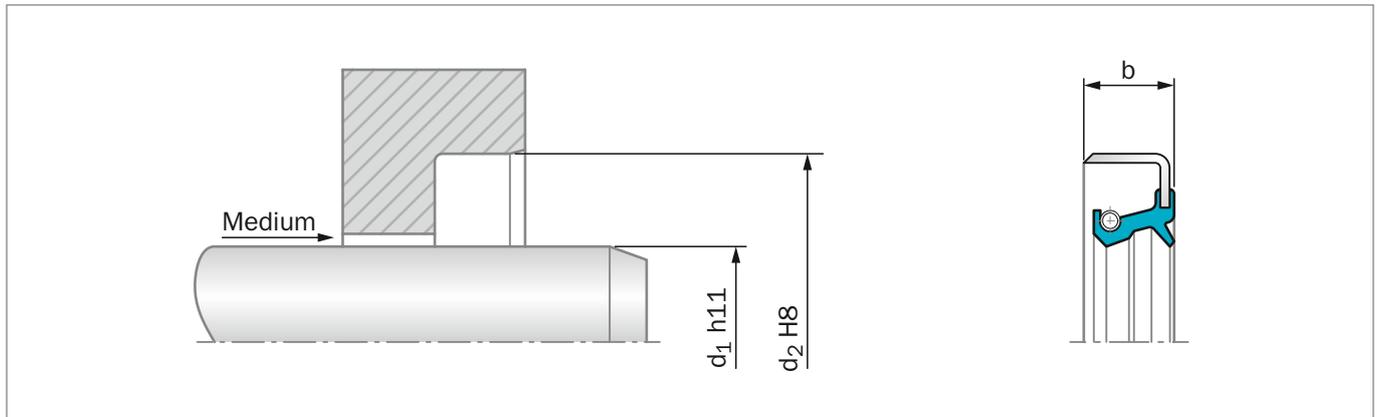

Figure 17: Installation Drawing

GENERAL DESCRIPTION

Trelleborg Sealing Solutions Type TRD are metal cased radial lip seals. The additional dust lip protects the main sealing lip against dust and other fine solid contaminants and therefore this type is recommended for use in polluted environments. To achieve a long lifetime a suitable lubricant between the two sealing lips should be applied. As the static sealing between housing and metallic shell is somewhat limited, low viscosity media can "creep". Better performance can be achieved with epoxy based resin O.D. coating. This special treatment is on request.

ADVANTAGES

- Effective protection against air side contaminants
- Good radial stiffness, especially for large diameters
- Good fitting stability avoiding pop-out of the seal
- Modern lip design provides low radial forces
- Cost effective

APPLICATION EXAMPLES

- Transmission systems (e.g. gearboxes)
- Pumps
- Electrical motors
- Machine tools
- Heavy engineering applications

OPERATING CONDITIONS

Pressure:	Up to 0.05 MPa
Temperature:	-40 °C to +200 °C (depending on material)
Speed:	Up to 10 m/s (depending on material)
Media:	Mineral and synthetic lubricants (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousand compatibility tests. Please ask your local Trelleborg Sealing Solutions marketing company for details.

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure and temperature.

Table 12: Materials

TSS Compound Reference	Standard Compound	Temperature °C	Standard Metal Insert	Standard Spring
N7MMR	NBR (70 Shore A)	-30 °C - 100 °C	Carbon steel	Carbon steel
4N011/4NV11	NBR (75 Shore A)	-30 °C - 100 °C	Carbon steel	Carbon steel
VCBVR	FKM (70 Shore A)	-20 °C - 200 °C	Carbon steel	Stainless steel
4V012	FKM (75 Shore A)	-20 °C - 200 °C	Carbon steel	Stainless steel

Special grades and other materials (ACM, EACM, EPDM, HNBR, VMQ) on request.
Metal insert, and spring can be supplied in different materials on request.

■ Type TRB

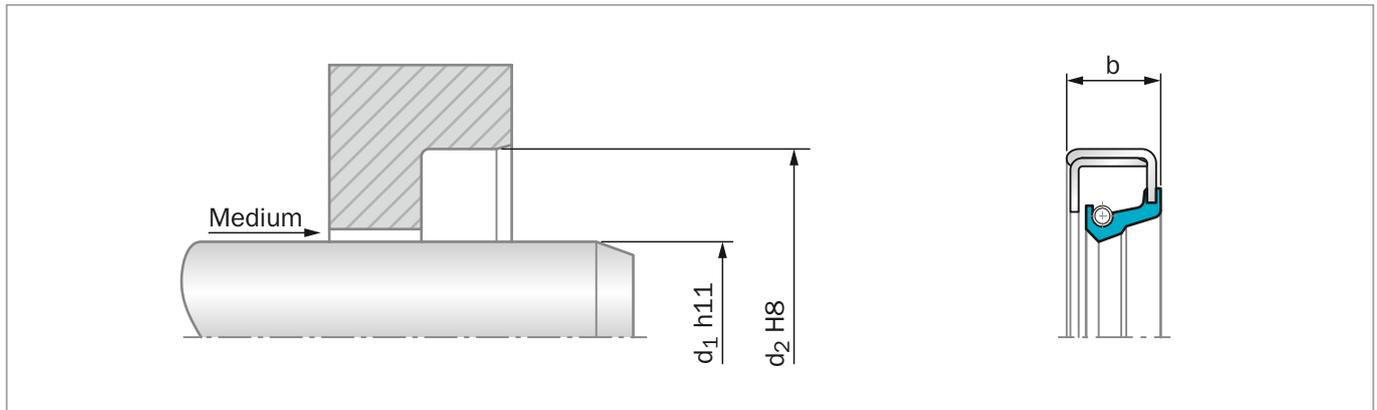

Figure 18: Installation Drawing

GENERAL DESCRIPTION

Trelleborg Sealing Solutions Type TRB are reinforced metal cased radial lip seals. The supplementary metal inner ring provides a superior stiffness. This type is not recommended for use in heavily polluted environments. As the static sealing between housing and metallic shell is limited, low viscosity media can "creep". Better performance can be achieved with epoxy based resin O.D. coating. This special treatment is on request.

ADVANTAGES

- Superior radial stiffness, especially for very large diameters
- Very good fitting stability avoiding pop-out of the seal
- Modern lip design provides low radial forces
- Cost effective
- Suitable for use in combination with axial seal (V-Ring and GAMMA-seal)
- Electrical motors
- Machine tools
- Heavy engineering applications (e.g. mills in steel industry)

OPERATING CONDITIONS

Pressure:	Up to 0.05 MPa
Temperature:	-40 °C to +200 °C (depending on material)
Speed:	Up to 10 m/s (depending on material)
Media:	Mineral and synthetic lubricants (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask your local Trelleborg Sealing Solutions marketing company for details.

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure and temperature.

■ Type TRF

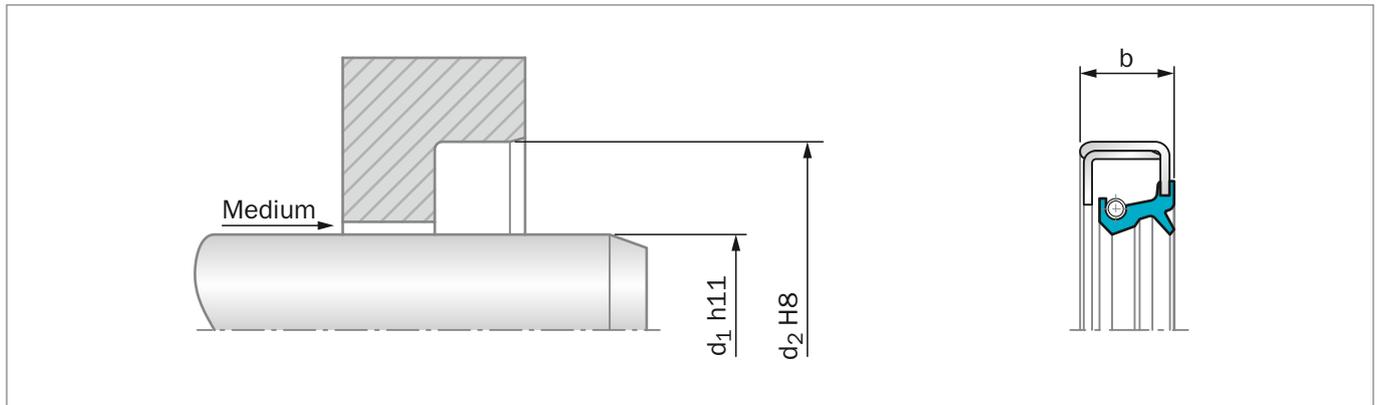

Figure 19: Installation Drawing

GENERAL DESCRIPTION

Trelleborg Sealing Solutions Type TRF are reinforced metal cased radial lip seals with dust lip. The supplementary metal inner ring provides a superior stiffness. This type is recommended for use in heavily polluted environments. To achieve a long lifetime a suitable lubricant between the two sealing lips should be applied. As the static sealing between housing and metallic shell is limited, low viscosity media can "creep". Better performance can be achieved with epoxy based resin O.D. coating. This special treatment is on request.

ADVANTAGES

- Superior radial stiffness, especially for very large diameters
- Very good fitting stability avoiding pop-out of the seal
- Modern lip design provides low radial forces
- Cost effective
- Suitable for use in combination with axial seal (V-Ring and GAMMA-seal)

APPLICATION EXAMPLES

- Transmission systems (e.g. gearboxes)
- Pumps
- Electrical motors
- Machine tools
- Heavy engineering applications (e.g. mills in steel industry)

OPERATING CONDITIONS

Pressure:	Up to 0.05 MPa
Temperature:	-40 °C to +200 °C (depending on material)
Speed:	Up to 10 m/s (depending on material)
Media:	Mineral and synthetic lubricants (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousand compatibility tests. Please ask your local Trelleborg Sealing Solutions marketing company for details.

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure and temperature.

■ Non-standard Radial Oil Seals

When standard seals in accordance with DIN 3760/3761 (Table 3) can not fulfill the technical requirements of the application, special seals are required.

Special seals are used for high speed, medium- or high-pressure or heavy duty applications, for example.

If a standard or special seal design will be used, the media compatibility with the compound needs to be given (see Figure 13).

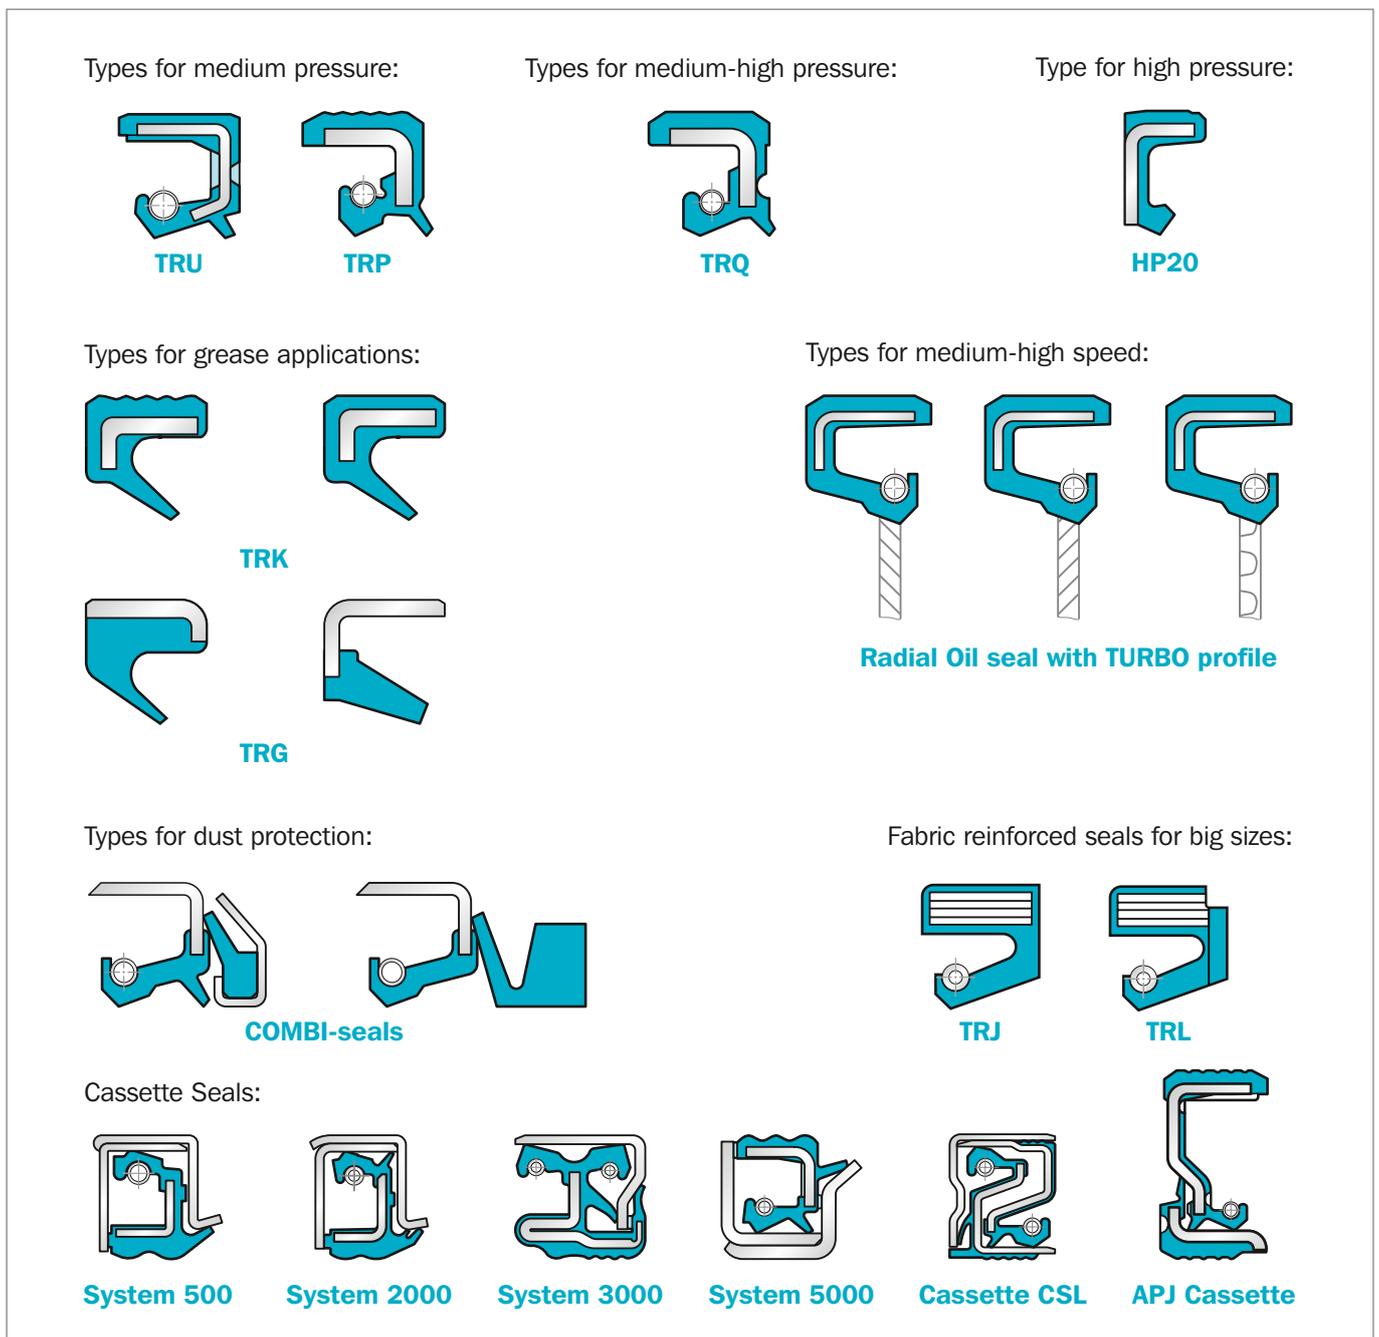

Figure 20: Selection of special radial seals

■ Type TRU – Medium Pressure Oil Seal

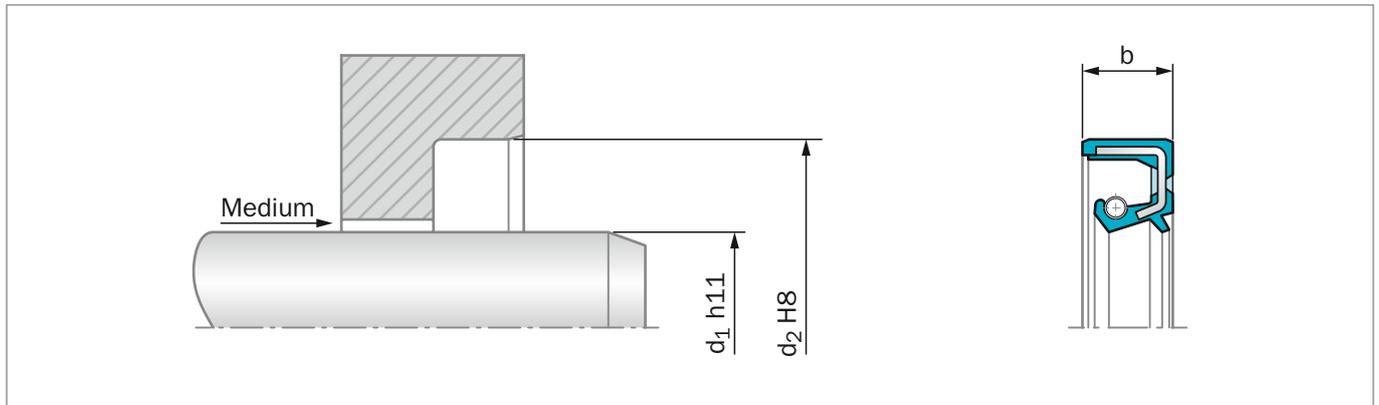

Figure 21: Installation Drawing

GENERAL DESCRIPTION

Trelleborg Sealing Solutions Type TRU is a seal with a completely rubber covered outer diameter. This type of seal is designed with an extended metallic support of the diaphragm that allows pressures up to 0.5 MPa. In order to avoid "pop-out" of the seal, we suggest to fit an axial retainer (e.g. circlip, shoulder, etc.). The additional dust lip protects the main sealing lip against dust and other fine solid contaminants and therefore this type is recommended for use in polluted environments. To achieve a long lifetime, a suitable lubricant between the two sealing lips should be applied.

ADVANTAGES

- Good static sealing
- Compensation of different thermal expansion
- Reduced risk of fretting corrosion
- Up to 0.5 MPa pressure at moderate peripheral speed
- Effective protection against air side contaminants
- No need for Back-up Ring

APPLICATION EXAMPLES

- Transmission systems (e.g. gearboxes)
- Pumps
- Hydraulic motors
- Machinery industry

OPERATING CONDITIONS

Pressure:	Up to 0.5 MPa
Temperature:	-40 °C to +200 °C (depending on material)
Speed:	Up to 10 m/s (depending on material)
Media:	Mineral and synthetic lubricants (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask your local Trelleborg Sealing Solutions marketing company for details.

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure and temperature.

■ Type TRP – Medium Pressure Oil Seal

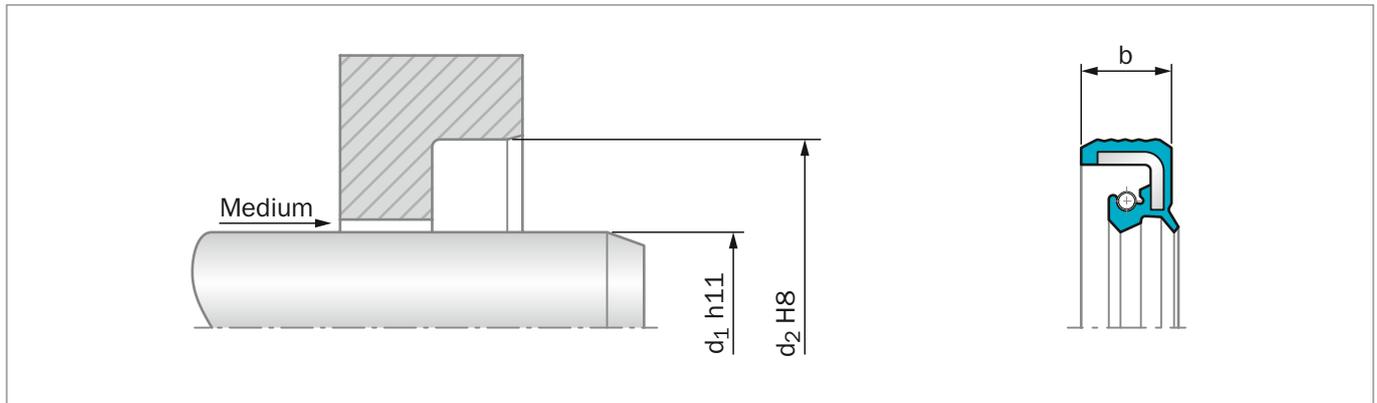

Figure 22: Installation Drawing

GENERAL DESCRIPTION

Trelleborg Sealing Solutions type TRP are seals with a completely rubber covered outer diameter. This type of seal is designed for pressures up to 0.5 MPa. In order to avoid "pop-out" of the seal, we suggest to fit an axial retainer (e.g. circlip, shoulder, etc.) The additional dust lip protects the main sealing lip against dust and other fine solid contaminants and therefore this type is recommended for use in polluted environments. To achieve a long lifetime, a suitable lubricant between the two sealing lips should be applied. The OD can be provided flat or waved.

ADVANTAGES

- Good static sealing
- Compensation of different thermal expansion
- Reduced risk of fretting corrosion
- Up to 0.5 MPa pressure at moderate peripheral speed
- Low lip and shaft wear at low pressure run
- Effective protection against air side contaminants
- No need for Back-up Ring

APPLICATION EXAMPLES

- Transmission systems (e.g. gearboxes)
- Pumps
- Hydraulic motors
- Machinery industry

OPERATING CONDITIONS

Pressure:	Up to 0.5 MPa
Temperature:	-40 °C to +200 °C (depending on material)
Speed:	Up to 10 m/s (depending on material)
Media:	Mineral and synthetic lubricants (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask your local Trelleborg Sealing Solutions marketing company for details.

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure and temperature.

Table 20: Materials

■ Type TRQ – Medium-high Pressure Oil Seal

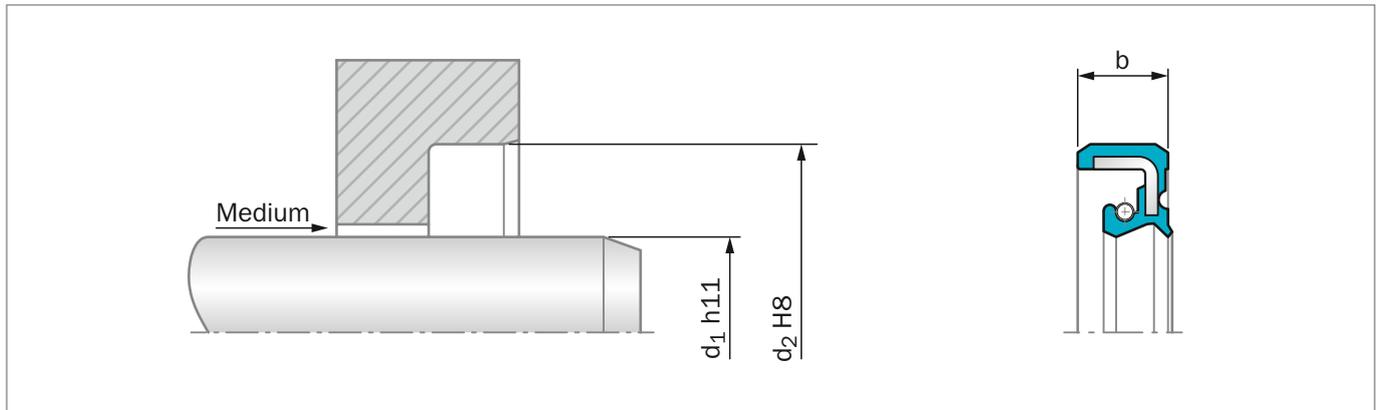

Figure 23: Installation Drawing

GENERAL DESCRIPTION

STEFA Type 12 CC (TRQ_D) is a seal with a completely rubber covered outer diameter. This type of seal is designed for pressures up to 1 MPa. In order to avoid "pop-out" of the seal, we suggest to fit an axial retainer (e.g. circlip, shoulder, etc.). The additional dust lip protects the main sealing lip against dust and other fine solid contaminants and therefore this type is recommended for use in polluted environments. To achieve a long lifetime, a suitable lubricant between the two sealing lips should be applied. The OD can be provided flat or waved.

ADVANTAGES

- Good static sealing
- Compensation of different thermal expansion
- Reduced risk of fretting corrosion
- Up to 1 MPa pressure at low peripheral speed
- Effective protection against air side contaminants
- No need of Back-up Ring.

■ Type HP20 – High Pressure Oil Seal

GENERAL DESCRIPTION

HP20 is a patented Radial Oil Seal providing an optimal sealing solution for hydraulic devices with rotating shafts and working pressures up to 20 MPa.

APPLICATION EXAMPLES

- Hydraulic drive motors
- Material handling
- Forestry and agriculture machinery
- Construction machinery
- Turf care
- Scissor lifts
- Winches

SPECIAL FEATURES

Lip extrusion prevented at high pressures, due to a metal retainer bonded to the elastomeric lip, while a patented pressure-balancing sealing lip design provides stable contact for the sealing lip on the shaft. Heat dissipation is improved through contact between the metal retainer and the housing plate

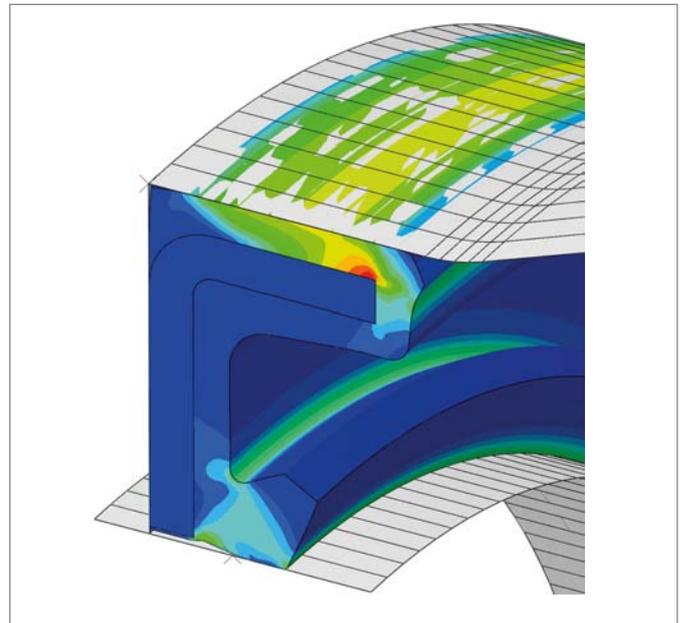

Figure 24: FEA at high pressure

MATERIALS AND OIL COMPATIBILITY

HP20 is composed of a metal retainer and an elastomeric sealing lip. The sealing lip is made from Trelleborg proprietary elastomers, specifically developed for working in high pressure hydraulic oil; standard available grades are Hydrogenated-Nitrile HNBR, Fluoroelastomer FKM, and high grade Fluoroelastomer FKM XploR; other special elastomer compounds can be used according to customer specifications.

The HNBR version operates with mineral oils according to DIN 51524-2 cat. HLP or ISO 11158 cat. HM (ISO 6743/4 cat. L-HM) or ISO VG46 – BDS ISO 3448, purity class 16/13 – ISO 4406 -1999.

FKM versions are also applicable with bio-degradable hydraulic oils (compatibility testing is recommended).

WORKING CONDITIONS

Speed and pressure working conditions

The main factors affecting the performance of HP20 seals are the pressure and speed combination, the oil type, temperature and flow amount.

The rated pressure vs. shaft speed working conditions are given in Figure 25.

Several tests have been performed to define this curve using hydraulic mineral oil ISO VG46 at +60 °C, an oil flow above 2 liters per minute, and an STBM eccentricity below 0.1 mm.

The real performance of HP20 seals in the field is affected by other parameters that are not possible to reproduce in the laboratory, such as shaft acceleration, the thermal conductivity

of the shaft and bore, oil contamination, system vibration and pressure transients in the oil. Trelleborg Sealing Solutions recommends customer testing on the device in the normal and worst case scenarios, to validate its functionality.

Trelleborg Sealing Solutions is available to evaluate special working conditions and suggest the best configuration of HP20 seals in terms of compound, metal retainer and sealing lip shape.

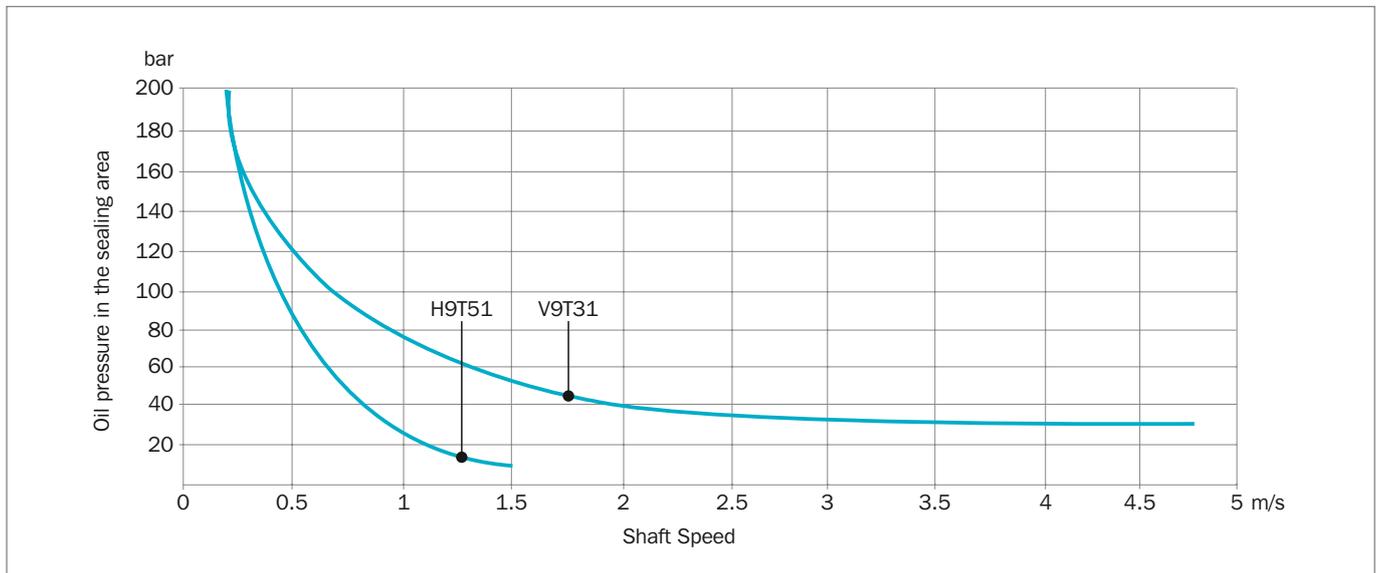

Figure 25: HP20 Rated Working Conditions for H9T51 and V9T31 Materials

Working eccentricity

HP20 seals, in order to work properly, requires the value of Shaft To Bore Misalignment (STBM) to be kept below the threshold given in the graph.

The STBM needs to be obtained through a proper tolerance study on the motor design, proper machining and installation, and appropriate bearings capable of supporting axial loads on the shaft and wear due to age.

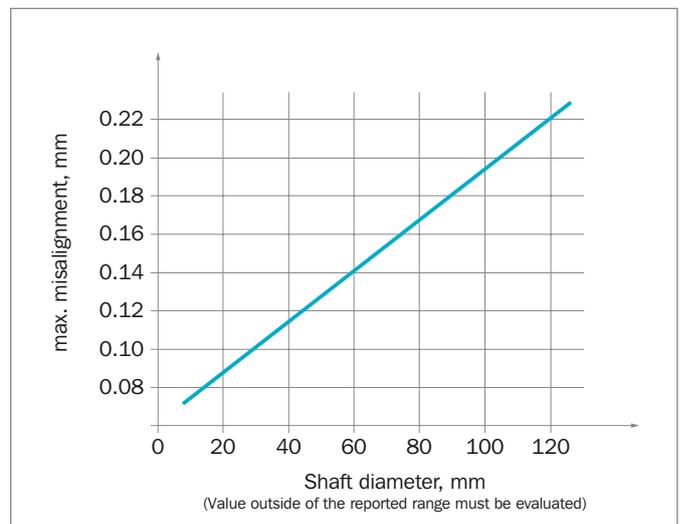

Figure 26: Shaft to bore misalignment

HOUSING AND SHAFT DESIGN

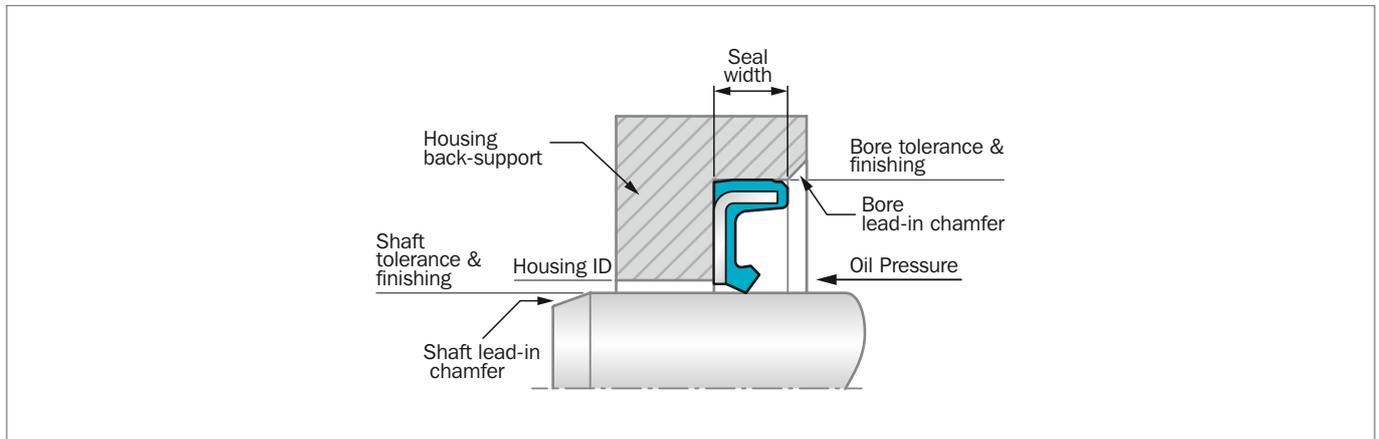

Figure 27: Installation Drawing

Shaft materials

HP 20 seal are for use with shafts manufactured from mild steel or stainless steel.

Shaft hardness

Required hardness is Rockwell-C 55; recommended 60 HRC.

Shaft finish

Required roughness is between 0.2 and 0.5 micrometers Ra with no machine lead. The most accepted method of obtaining this finish is plunge grinding.

Shaft geometry

HP20 seals are designed to work with shaft tolerance h11. Shaft chamfer must be aligned with the values given in Table 24 and Table 25 and sharp edges radiused to avoid damaging sealing lips during installation.

The shaft surfaces over which the seal lip slides during installation should be kept smooth and free from any burrs or rough patches.

Table 24: Shaft lead-in chamfers

Ø Shaft mm	Shaft Chamfer Length mm	Shaft Chamfer Angle deg
16 - 30	2.00 (±0.10)	20°
30 - 40	2.20 (±0.10)	20°
40 - 50	2.50 (±0.10)	20°
50 - 70	3.20 (±0.10)	20°
70 - 120	4.50 (±0.12)	20°

Housing materials

HP20 benefits from being installed in a highly thermally conductive material housing.

Bore finishing

A finish of 2.5 micrometers Ra or better is recommended.

Bore geometry

- Bore tolerance is H8
- Bore lead-in chamfer according to Table 25
- Housing must be provided with back-support for the HP20 seal to retain the pressure force and dissipate heat from the back face of the HP20 seal; the back support must have the same ID as the HP20 metal retainer

Shaft to bore misalignment

- The maximum assembly and working misalignment must be according to Figure 26

Table 25: Bore lead-in chamfers

Ø Shaft mm	Seal Width mm	Bore Chamfer Length mm	Bore Chamfer Angle deg
16 - 30	4.2 - 5.5 (±0.20)	1.00	15°
30 - 40	4.5 - 6.5 (±0.20)	1.20	15°
40 - 50	5.5 - 7.0 (±0.20)	1.30	15°
50 - 70	6.0 - 7.5 (±0.25)	1.50	15°
70 - 120	7.5 - 9.5 (±0.30)	1.70	15°

INSTALLATION

HP20 seals are usually first assembled on the metal housing, and then the shaft is fitted inside the seal from the air side or from the oil side depending on device and bearing positioning.

During assembly operation, it's necessary to apply a good layer of grease to both the sealing lip and shaft, in order to:

- provide smooth sliding of the lip on the shaft during assembly
- provide pre-lubrication during the first turns of the shaft

The type of grease recommended for this operation is an LS-EP2 grease.

It's very important to align the cover and the shaft with a precentering system to avoid stress on the sealing lip. While fitting the shaft inside the seal, gently rotate the shaft in order to reduce to assembly tension created during the installation process.

Never install a seal over splines or keyways without using a special installation tool that protects the seal lip from contact with sharp edges.

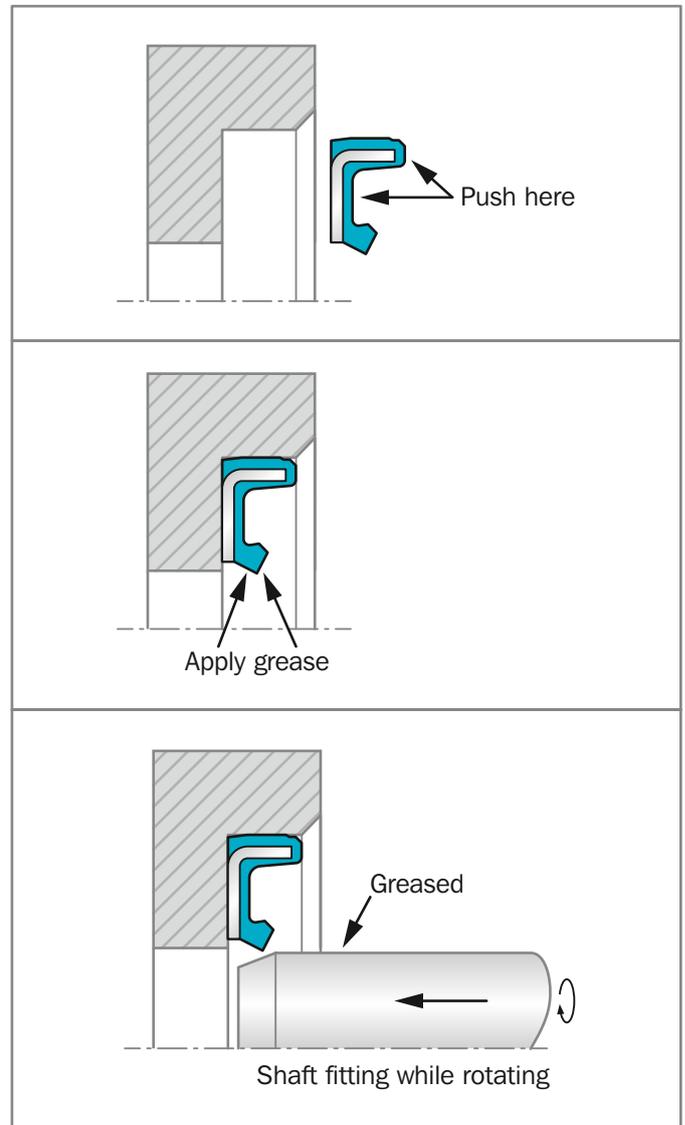

Figure 28: Installation Instructions

**Table 26: Materials**

■ HiSpin® HS40

GENERAL DESCRIPTION

HiSpin® HS40 offers e-Mobility and high speed electric motor manufacturers a long life and energy saving bi-directional rotary seal. It consists of a flexible lip made from proprietary, high-performance XLT fluoroelastomer material and supported by a metal core to provide cost-effective performance and reliability. A compact footprint reduces the amount of installation space required and its back-pumping feature further reduces friction and improves sealing performance.

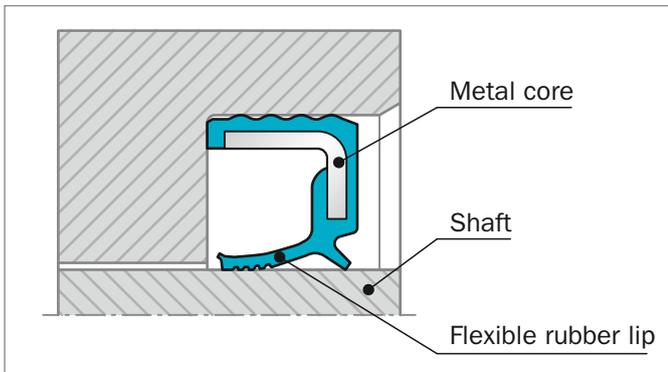

Figure 29: HiSpin® HS40

METHOD OF OPERATION

Developers are continuously improving the effectiveness of the electric drive unit; a combined electric motor and gearbox in a shared housing.

The drive unit is the main cost-driver of future electric vehicle development and offers new challenges for automotive manufacturers. While the gearbox requires efficient lubrication, it is essential that the motor remains dry. Therefore, a highly reliable seal is required between the two parts.

Providing outstanding low friction capabilities, HiSpin® HS40 meets the demanding conditions of automotive high-speed electric motors. A unique hydrodynamic feature helps reduce frictional torque, while oil back-pumping leads to improved sealing performance without causing any shaft damage.

Our proprietary XLT high-performance fluoroelastomer (FKM) elastomer range provides outstanding resistance to extreme engine conditions resulting from high motor speeds and aggressive synthetic ATF fluids. Testing of the new generation XLT compounds has proven that these low temperature FKM grades outperform and extend the temperature performance capability of traditional FKM elastomers.

ADVANTAGES

- High speed operation (up to 40 m/s)
- Bi-directional sealing capability
- Compact design to reduce assembly space
- Wide temperature range, from -45 °C to +200 °C
- Can handle run-out of up to 0.1 mm
- Excellent sealing performance in different lubricated environments
- Adds value with low frictional torque
- Reduces heat development
- Proven compatibility with various e-Mobility transmission fluids
- Negligible shaft wear
- Easy installation
- Cost-effective
- Available in different outer diameter configurations, e.g. partially rubber covered and air vents on the outer diameter
- Available in other materials, such as ACM
- Provide in accordance with IATF 16949

APPLICATION EXAMPLES

HiSpin® HS40 provides optimal sealing in:

- Electric drive units for e-Mobility applications
- High speed electric drive units
- Automotive transmissions
- Servo-motors
- Pumps

OPERATING CONDITIONS

Seal performance is influenced by such factors as lubrication capability of the sealed media and heat dissipation in the hardware, it follows that testing should always be performed. With good lubrication, the following values can be assumed as a guideline:

Pressure:	0.5 bar
Temperature:	-45 °C to +200 °C
Speed:	Up to 40 m/s
PV:	dependent upon design and application
Acceleration:	dependent upon design and application
Media:	Commonly specified fluids for e-Mobility & transmission applications

MATING SURFACE MATERIALS

Sealing of applications with rotating movements requires very good mating surfaces. A minimum hardness of 55 HRC to a hardening depth of at least 0.5 mm is recommended.

Ra:	0.1 - 0.2 μm
Rz:	1.0 μm
Bearing ratio (Tp (Mr)):	(50 - 70% @ depth of p = 0.25 Rz (Rtm); relative to a ref. line c: 5% tp)
Mating surface hardness:	min. 55 HRC

IMPORTANT NOTE

Housing design and correct installation are important for the performance of the HiSpin® HS40. Information on shaft and housing design with installation guides are available from your local Trelleborg Sealing Solutions marketing company.

AGING AND TORQUE

To prove the performance and longevity of HiSpin® HS40, testing using real-world speeds and media likely to be encountered during operation has been undertaken. Test conditions are given in Table 28 and the running profile is shown in Figure 30.

Table 28: Test Conditions for HiSpin® HS40

Shaft diameter:	\varnothing 38 mm
Shaft speed:	21,000 rpm
Temperatures:	up to +150°C
Media:	ATF Fluid
Test cycle:	Load cycle according to figure and according to ISO 6149
Test duration:	500 hours

Figure 30: Example running profile showing varying rotational speeds throughout testing

Testing demonstrated noticeably lower volume change in Mobil LV ATF HP media than other commonly used materials (Figure 31). Similarly, when compared with standard Radial Oil Seals, HiSpin® HS40 generates significantly less torque, even at high rotational speeds (Figure 32).

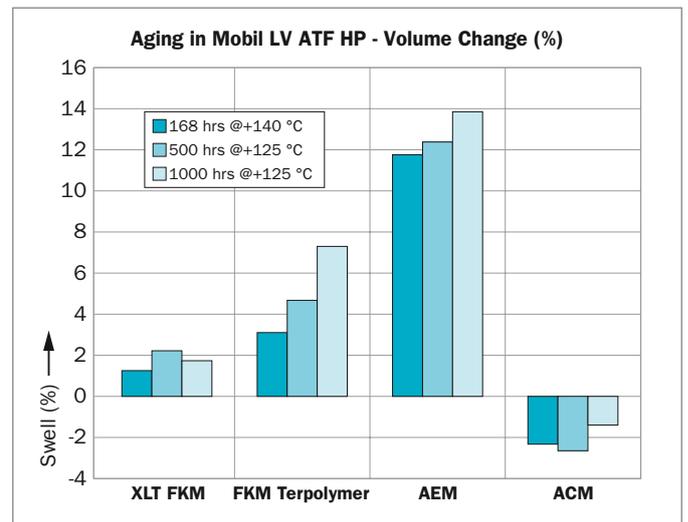

Figure 31: Volume Change (%) for HiSpin® HS40 in Mobil LV ATF HP

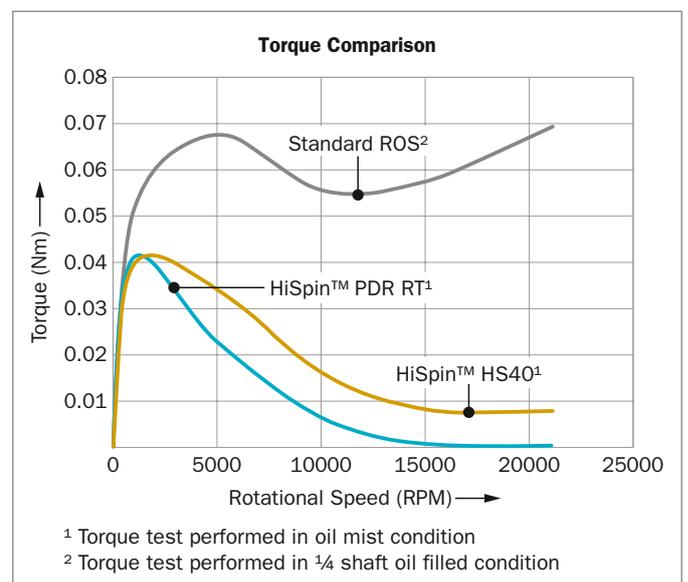

Figure 32: Torque comparison for HiSpin® products versus standard Radial Oil Seals.

ORDERING INFORMATION

Due to the design requirements of this product, contact your local Trelleborg Sealing Solutions marketing company to place an order or for further information.

■ Type TRK – Medium Grease

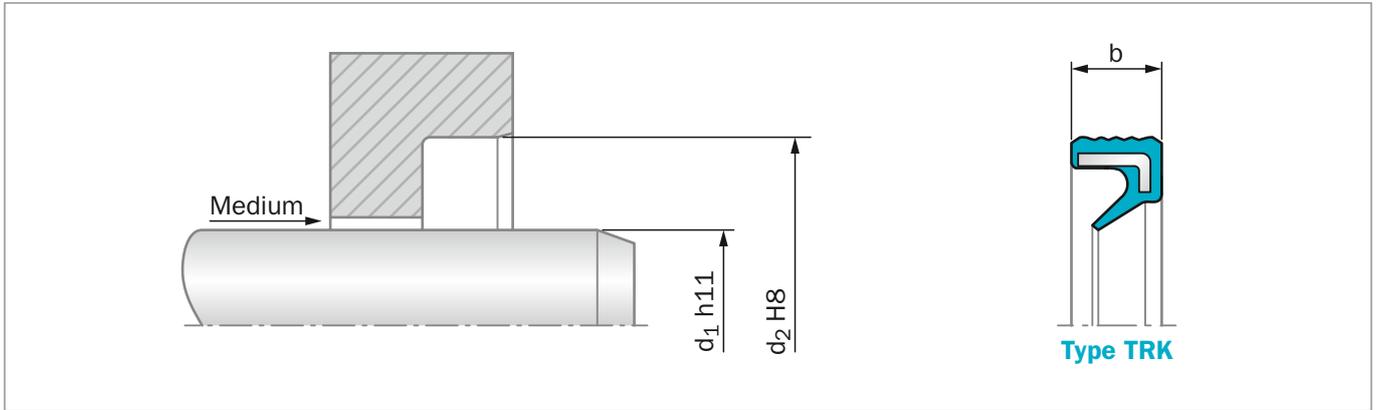

Figure 33: Installation Drawing

GENERAL DESCRIPTION

The Trelleborg Sealing Solutions Type TRK are specially designed Radial Oil Seals reinforced with a metal insert, but without a spring-energized sealing lip, and a wavy rubber covered outer diameter. Flat rubber covered outer diameter is available on request. These types are not recommended for use in heavily polluted environments.

ADVANTAGES

- Good static sealing and thermal expansion compensation
- Low friction and low heat generation
- Extremely compact design
- Low radial force provides low break-out torque
- Suitable for scraper applications

APPLICATION EXAMPLES

- Roller bearings
- Tooling fixtures (e.g. drilling machines)
- Sealing against viscous media (e.g. grease)
- Supplementary excluders (shaft ends)
- Axle King Pin seals

OPERATING CONDITIONS

Pressure:	Without pressure
Temperature:	-40 °C to +200 °C (depending on material)
Speed:	Up to 10 m/s
Media:	Mineral and synthetic base greases

Trelleborg Sealing Solutions has carried out several thousand compatibility tests. Please ask your local Trelleborg Sealing Solutions marketing company for details.

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure and temperature.

■ Type TRG – Medium Grease

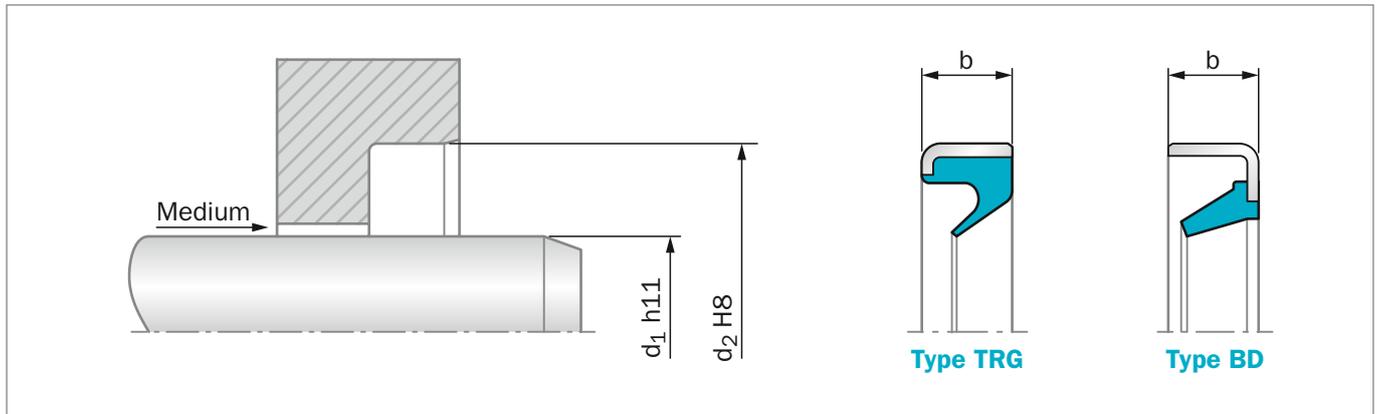

Figure 34: Installation Drawing

GENERAL DESCRIPTION

The Trelleborg Sealing Solutions Type TRG and STEFA Type BD are special metal cased Radial Oil Seals without spring energized sealing lips. These types are not recommended for use in heavily polluted environments. As the static sealing between housing and metallic shell is limited, low viscosity media can "creep". Better performance can be achieved with Epoxy based resin outer diameter coatings. This special treatment is available on request.

ADVANTAGES

- Good radial stiffness
- Good fitting stability avoiding pop-out of the seal
- Low friction and low heat generation
- Extremely compact design
- Low radial force provides a low break-out torque
- Suitable for scraper applications

APPLICATION EXAMPLES

- Roller bearings
- Tooling fixtures (e.g. drilling machines)
- Sealing against viscous media (e.g. grease)
- Supplementary excluders (shaft ends)
- Axle King Pin seals

OPERATING CONDITIONS

Pressure:	Without pressure
Temperature:	-40 °C to +200 °C (depending on material)
Speed:	Up to 10 m/s
Media:	Mineral and synthetic base greases

Trelleborg Sealing Solutions has carried out several thousand compatibility tests. Please ask your local Trelleborg Sealing Solutions marketing company for details.

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure and temperature.

Table 31: Materials

TSS Compound Reference	Standard Compound	Temperature °C	Standard Metal insert	Standard spring

Turbo Seals with Hydrodynamic Sealing Aids

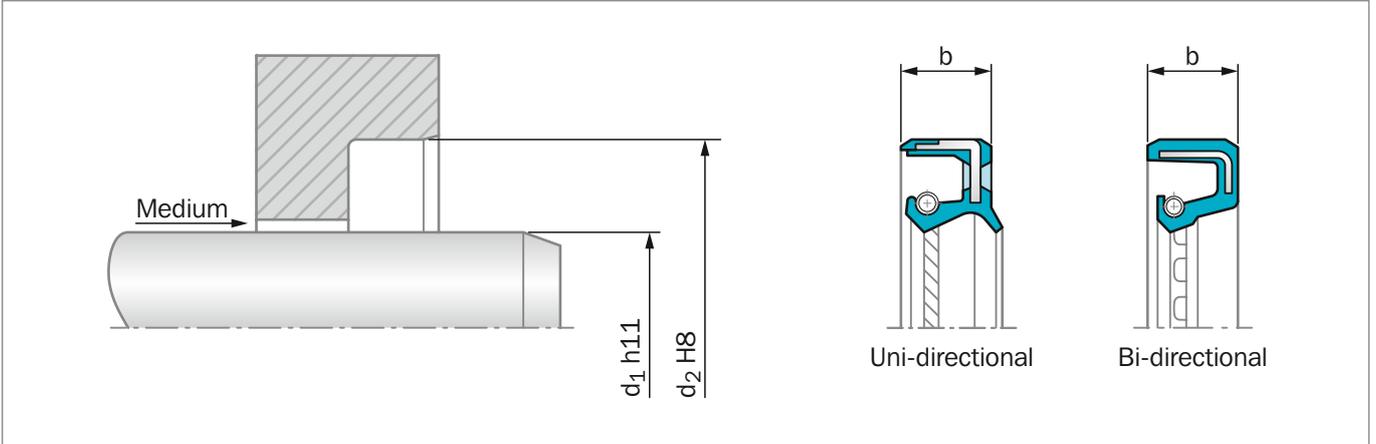

Figure 35: Installation Drawing

GENERAL DESCRIPTION

Trelleborg Sealing Solutions Turbo Seals are a range of seals with specially-shaped lips, including added ribs or other geometric features.

Optimum conditions are attained when a thin film of lubricant is formed so the lip does not come in to contact with the shaft, which the Turbo Seals create.

The hydrodynamic sealing aids support the sealing function by increasing shaft speed.

The frictional loss of the Turbo Seals is significantly lower than that caused by conventional radial seals without hydrodynamic sealing aids.

The pumping effect starts at a relatively low shaft speed. The pumping effect is understood as the capacity of the seal to pump the sealed medium from the air side to the medium side. In order to avoid leakage at low speed or at standstill, Turbo Seals include a static sealing edge which provides a continuous contact line against the shaft.

FRICTION

The use of certain materials for the sealing element is limited primarily by the heat generated by friction, superimposed on the ambient temperature.

Owing to the enhanced formation of a lubrication film, Turbo Seals can be used for appreciably higher peripheral speeds than conventional seals made of the same material. Figure 36 shows the frictional losses of conventional seals, single-acting and bi-directional Turbo Seals, as determined during comparative laboratory tests. Turbo Seals can withstand

speeds of 16 m/s before reaching the same frictional losses as a conventional seal operating at 10 m/s.

OPERATING CONDITIONS

Speed:	Up to 20 m/s (depending on material)
Media:	Mineral and synthetic lubricants (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask your local Trelleborg Sealing Solutions marketing company details.

■ Rotary and Axial Seal Combination

GENERAL DESCRIPTION

Lip seals often fail because of the destruction of the lubricant film due to the ingress of dirt, dust and moisture, resulting in rapid wear. The use of shaft seals with one or more auxiliary sealing lips (dust lips) provides limited improvement, but is not always sufficient. In order to meet the constantly increasing sealing requirements, especially for increased environmental protection and longer service life, the Trelleborg Sealing Solutions COMBI-seal offers a simple solution. It is particularly well suited to critical applications with heavy contamination. The COMBI-seal consists of a GAMMA seal and a rotary shaft lip seal working together. The lip seal provides the counterface for the GAMMA seal which is fixed to the shaft by press fit (see Figure 37 and Figure 38).

Another frequently used alternative for these types of application consists of a V-Ring with a standard Radial Oil Seal type TRC, TRD, TRB, TRF.

The rotary shaft seal should be ordered **"Without Markings"** on the air side.

RADIAL OIL SEAL + GAMMA SEAL

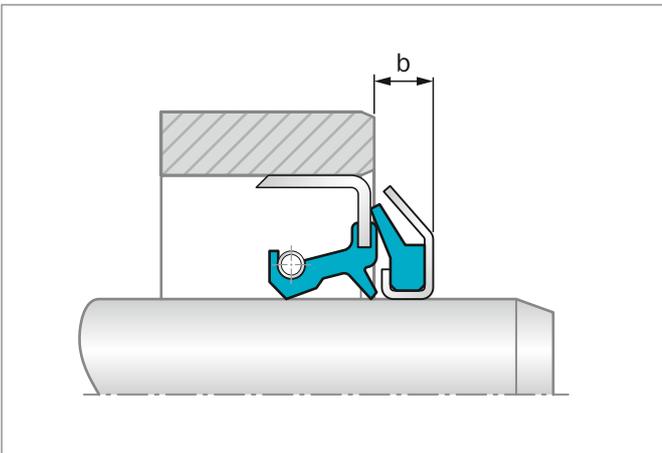

Figure 37: GAMMA seal fitted on the shaft end

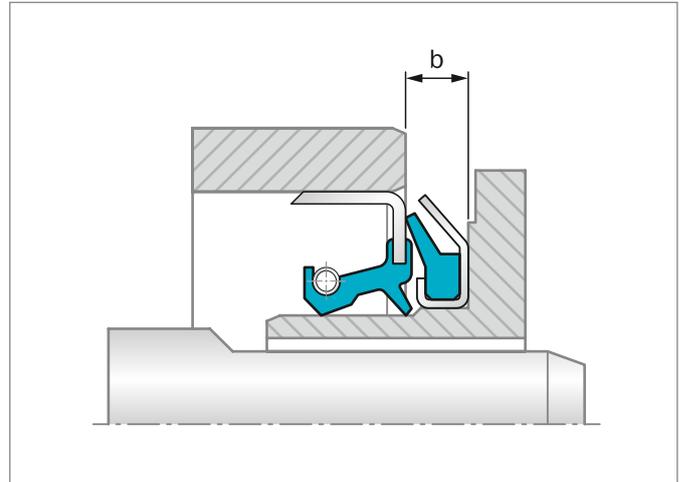

Figure 38: GAMMA seal fitted on the shaft boss

RADIAL OIL SEAL + V-RING

The function of the rotary axial seal is to prevent intrusion of particles and water through centrifugal forces.

In other words, it adds its original protection capacity to the radial seal functionality. Sufficient space is required on the shaft to host the axial seal width (see Figure 39).

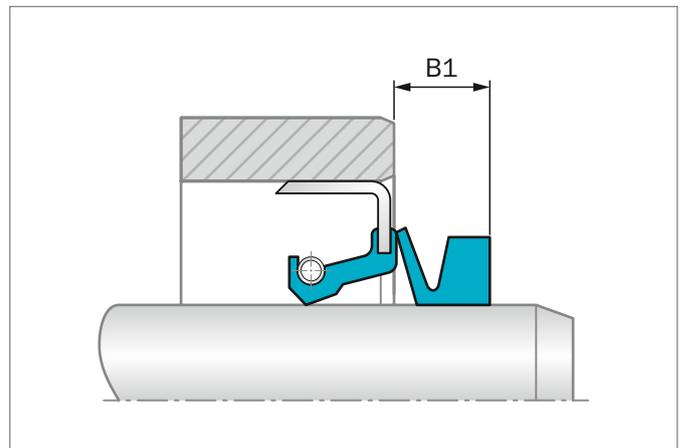

Figure 39: V-Ring fitted on the shaft end

HOUSING AND SHAFT DESIGN

The radial lip seal needs to be assembled in the housing according to usual fitting instructions. Both the V-Ring and GAMMA seal are assembled later on the shaft. The shaft design requires adaptation by an elongation corresponding at least to B1 (b) dimensions. In case of very high peripheral speeds, the V-Ring body should be radially supported. Also see page 161.

PRODUCT DESCRIPTION

The combination of radial shaft seal with V-Ring or GAMMA seals is recommended for use in heavily polluted environments.

Both the radial shaft seal and the GAMMA seal housing may also be manufactured with a different metal shell, as well as different rubber types for sealing elements. See specific paragraphs.

ADVANTAGES

- Longer service life and high function reliability
- Good IP protection for electrical motors (VDE-Norm 0470-1)
- Good protection against water splash and welding sparks
- Simple handling
- Superior total economy
- Friction loss decreases with increasing shaft speed

APPLICATION EXAMPLES

Typical applications are all equipment working in contaminated environments where dust, foreign matter and liquid splatter are present.

Some examples:

- gear motors
- journal and gear transmissions
- bearing housings
- power saws
- utility vehicles
- agricultural machinery and equipment
- wheel hubs
- propeller shafts
- pumps
- hydraulic motors
- tool machinery
- equipment for steel manufacturing
- metal working machinery

OPERATING CONDITIONS

Pressure:	See radial seal data
Temperature:	-40 °C to +200 °C (depending on material)
Speed:	Up to 10 m/s (depending on material)
Media:	Mineral and synthetic oils (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask your local Trelleborg Sealing Solutions marketing company for details.

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure and temperature.

MATERIALS

See specific chapters.

ORDERING EXAMPLE

Order components separately as per specific chapters. Order the radial oil seals "**without marking**".

■ Type TRJ/TRL

FIBER REINFORCED OIL SEALS FOR LARGE DIAMETER

Fiber reinforced oil seals contain no metal parts with the exception of the spring. Instead of the metal insert, a reinforced fiber component is molded into the body of the seal. Damage through transport and mounting is consequently excluded.

Fiber reinforced oil seals are mainly used for installation in constructions and equipment with large diameters. The use of an axial retaining plate is necessary except for the type TRJ/F and respectively for the type TRL/F.

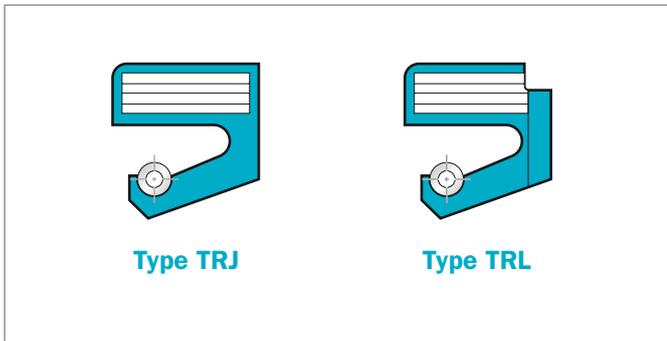

Figure 40: Fiber reinforced design for large diameters

SPLIT VERSION

To ease the mounting, or in case of repair, the types TRJ and TRL are also available in split versions.

To ensure effective sealing at the split ends, a full rubber section is molded at the join so that contact between homogeneous elastic surfaces maximizes the sealing effect. The interface should always be above the oil level.

If two seals in split versions are mounted together, the interface should be turned a minimum of 30° to the side.

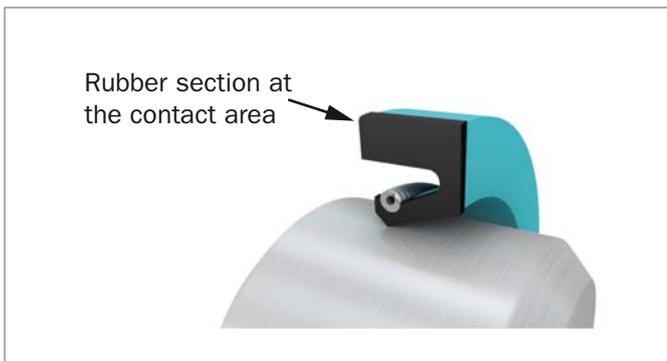

Figure 41: Contact area, split seal

SEPARATION OF TWO MEDIA WITH TYPE TRL

A single oil seal should not be used for the separation of two media. In such cases, two seals are fitted in a back to back arrangement. The type TRL is suitable for the sealing of large diameters. It is a special design with peripheral and radial grooves where a lubricant could be applied.

The peripheral groove on the seal reduces the need to cut a groove in the housing (see Figure 42).

The seal can be used for:

- Isolation of two media
- If lubrication is necessary from the outside

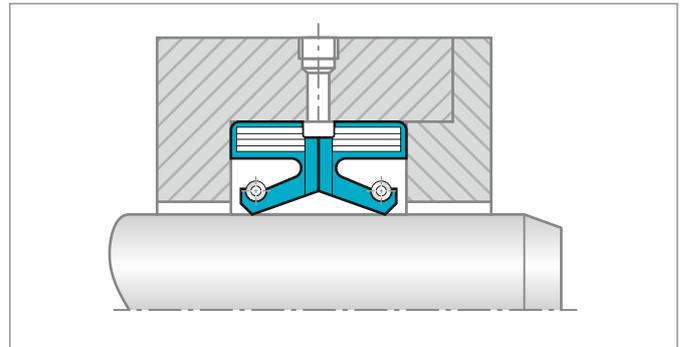

Figure 42: Type TRL mounted back to back

SPECIAL DESIGN TRJ/F AND TRL/F WITH REINFORCED SHOULDER

Whenever a retaining plate cannot be fitted we can supply a seal made in a special hardened compound, namely type TRJ/F and TRL/F, which makes the seal self-retaining and providing effective sealing at the O.D.

Trelleborg Sealing Solutions type TRJ/F and TRL/F are supplied in standard form and are not available in split versions (see Figure 43).

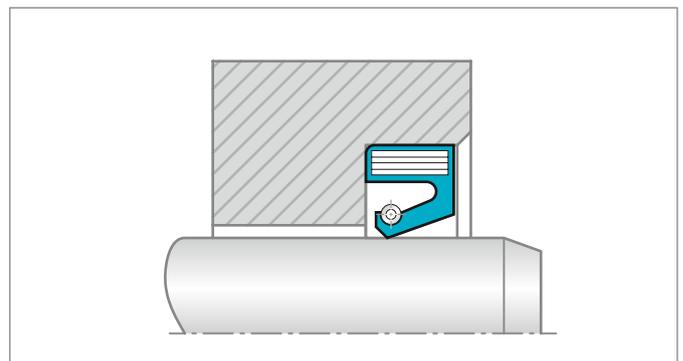

Figure 43: Type TRJ/F mounted without axial retaining plate

DESIGN INSTRUCTIONS

Installation on the shaft

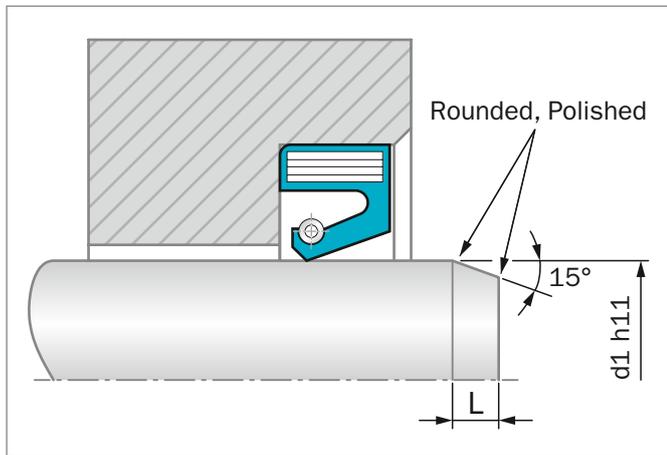

Figure 44: Installation of the oil seal

To facilitate the installation of the seal with minimum risk of lip damage, the shaft require a 15° chamfer with length "L" as the function of its diameter "d1".

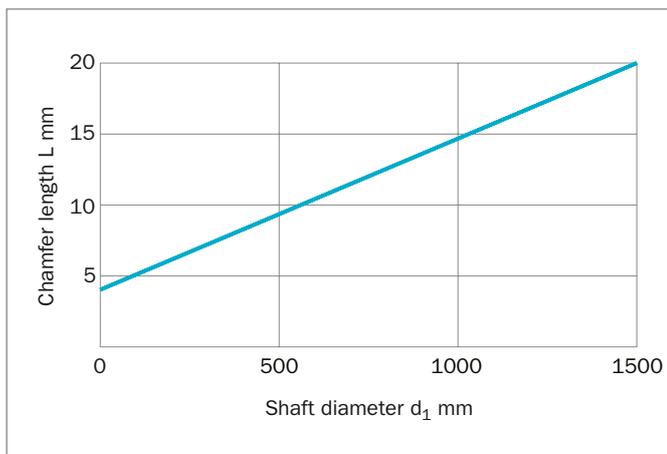

Figure 45: Chamfer length as a function of the shaft diameter

Eccentricity

Eccentricity between the shaft and housing bore centers should be avoided in order to eliminate unilateral load of the lip.

Table 34: Static Eccentricity

d1	b x f (mm)	max. stat. Ecc. (mm)
100 - 250	16 x 20	0.50
250 - 400	20 x 22	0.55
400 - 600	22 x 25	0.62
> 600	25 x 32	0.70

Shaft run out

Shaft run out should be avoided or kept to a minimum. At higher speeds there is a risk that the inertia of the sealing lip prevents it from following the shaft movement. The seal must be located next to the bearing and the bearing play be maintained at the minimum value possible.

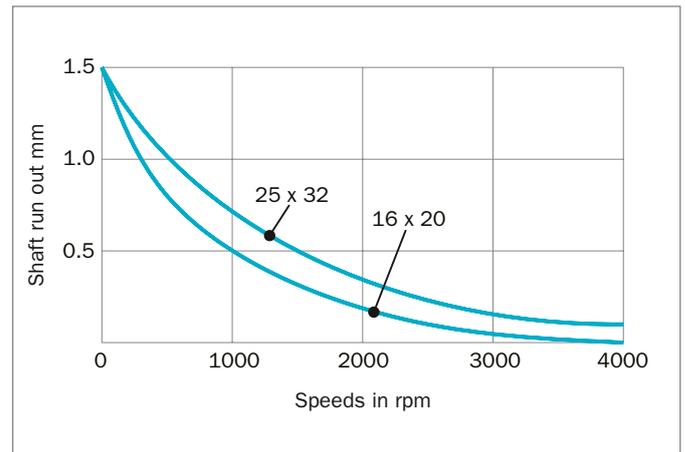

Figure 46: Shaft run out

Installation in the gland

The static seal in the mounting bore is provided by the corresponding force fit allowance at the outer sheath of the seal.

The bore tolerance is specified to DIN ISO 286T2-H8.

Values for the surface roughness in the gland are specified in ISO 6194/1.

General values:	Ra	=	1.6 - 3.2 μm
	Rz	=	6.3 - 12.5 μm

For gas sealing, a good score-free and spiral-free surface finish is necessary. If the rotary shaft lip seal is bonded into the housing, ensure that no adhesive comes into contact with the sealing lip or the shaft.

The bore d2 of the sealing housing indicated in Table 34 as a function of shaft diameter. (d2= d1+2 x f), see page 105.

The width (b) including the tolerance is also given in Table 35.

INSTALLATION, TYPE TRJ

Cassette Seal

■ Cassette Seal

■ General Description

The Cassette Seal has been developed to meet the ever-increasing requirements of long service life, high functional reliability, environmental safety, simple handling and superior total economy. Cassette Seals are fully enclosed seals with an integrated sealing system, that perform the function of oil seal, wear sleeve and dust protection in one unit. No extra components such as shaft sleeves or dirt protection are needed.

Unique to all the Trelleborg Sealing Solutions Cassette Seals is that the sealing lip is fixed on the stationary part of the hardware. Because of this the sealing force is constant, independent of the rotary speed. Cassette Seals consist of several individual features working together, built into one unit and for this reason they are called "Systems".

Cassette Seals are originally designed at FORSHEDA AB in Sweden under the trade name STEFA.

■ System 500

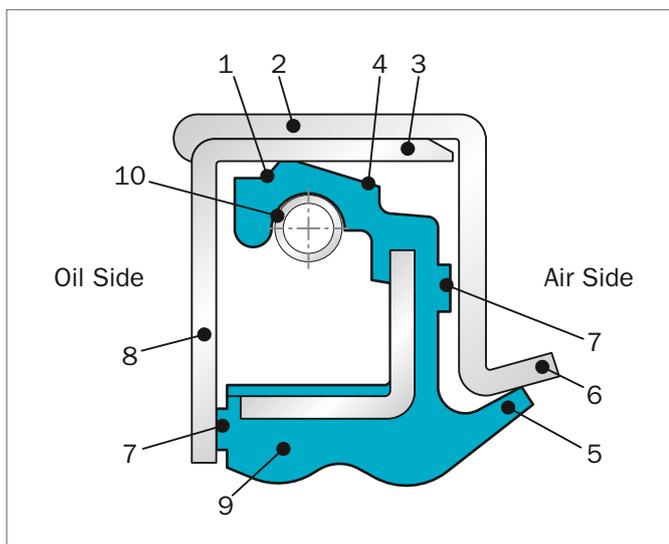

Figure 50: System 500

System 500, the original Unitized Wheel Hub Seal for heavy-duty vehicles, is designed for rotating hubs. The inner section of the System 500 is secured against the shaft. The outer section, press fitted into the wheel hub, rotates together with the hub around the inner section, creating a completely enclosed seal. Dirt and water, the major enemies of hub seals, are effectively kept at distance, whilst the lubrication of the rubber lip remains intact. This decreases friction and increases seal life accordingly.

THE MAIN FEATURES OF THE SYSTEM 500 ARE:

- The sealing (1) element is non-rotating, which means that the radial force is kept unchanged at various speeds.
- The sealing surface (2) is in close contact with the wheel hub, which gives an excellent heat transfer.
- The structure of the sealing counterface (3) has been chosen after several thousands of test hours. The position of the sealing lip ensures best lubrication.
- The sealing lip (4) normally has bi-directional TURBO-pattern (see page 122).
- Integral prelubricated dust-sealing (5) functions.
- The protruding conical part (6) of the case deflects heavier particles due to the centrifugal force.
- The excluding lip (5) protects against water splash and finer particles.
- Molded distance lugs (7) automatically locate the sealing element in the right position.
- The lugs (7) are spaced and dimensioned to ensure the sealing lip has adequate lubrication.
- The inner case (8) also protects the sealing lip from direct oil spray caused by taper roller bearings.

The robust ribs (9) give:

- a firm seat on the shaft
- a smooth sliding during installation
- a positive static seal even if one of the ribs is located on a defective shaft surface
- The compression spring (10) maintains the radial force. The initial force exerted by the sealing element will in some applications reduce due to aging of the rubber exposed to heat, load or chemical action.
- For such applications where the seal is exposed to dirty environment, i.e. off road use, the System 500 can be equipped with an additional specially developed dirt protection, the HRV seal.
- In cases where the space does not allow the use of the HRV seal, the System 500HD, a derivative of System 2000 (with additional dust lip), can be used. It has the same outside dimensions, but an extra dust lip inside. Since the casing is identical to System 500 it is readily available in the same sizes. Please contact your local Trelleborg Sealing Solutions marketing company for more details.

■ System 2000

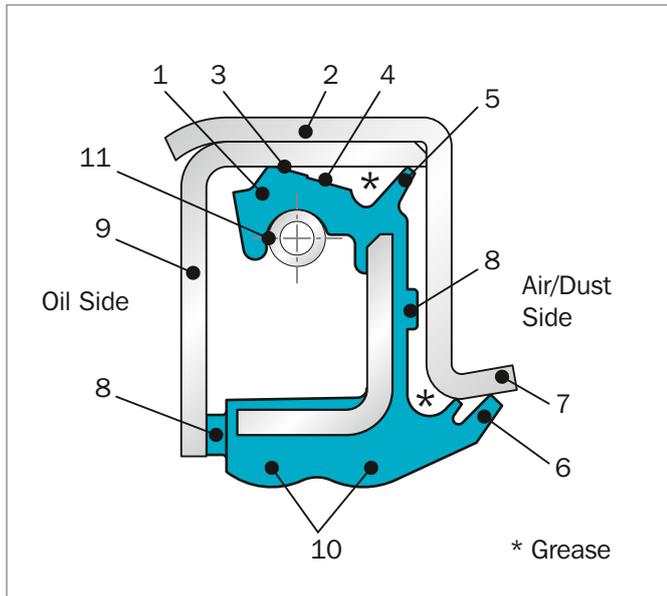

Figure 51: System 2000

System 2000 is a Unitized Cassette Seal suitable for wheel hubs working in heavily polluted environments, like agricultural and construction vehicles.

Like for System 500 and System 3000, the inner section of the System 2000 is secured against the shaft and is rubberized, while the outer section is press fitted into the bore, and rotates together with the hub around the inner section, creating a completely enclosed seal; the outer diameter can be provided by a sealing paint to increase the static sealing functionality in critical conditions, for example when the bore surface is porous or scratched.

Dirt and water, the major enemies of the off road hub seals, are effectively kept at distance thanks to the many sealing lips, whilst the lubrication of the rubber lip remains intact and is assured by the packing grease. This decreases friction and increases seal life accordingly.

System 2000 is limited in speed compared to System 500, due to the higher number of internal dust sealing lips.

MAIN FEATURES OF SYSTEM 2000

- The sealing (1) lip, if the Cassette Seal is assembled in rotating wheel hubs, is non-rotating and this feature allows the radial force to be kept stable at various speeds.
- The outer sealing surface (2) is in close contact with the wheel hub, which gives an excellent heat transfer.
- The structure of the sealing counter face (3) has been chosen after several thousand test hours. The position of the sealing lip ensures best lubrication.
- The sealing lip (4) normally has a bi-directional TURBO pattern engraved, that improves the sealing capability.
- The internal dust-sealing lip (5), located just behind the primary sealing lip, creates a supplementary grease lubrication chamber near the sealing edge and guarantees an extra barrier against dirt/pollution/water ingress
- External double dust-sealing lips (6) with tailored progressive contact load, provides an optimized protection against contaminants while keeping friction low.
- The protruding conical part (7) of the case deflects heavier particles thanks to the centrifugal force.
- Molded distance lugs (8) automatically locate the sealing element in the right position during assembly; they are spaced and dimensioned to ensure adequate lubrication to the sealing lip.
- The inner case (9) protects the sealing lip from direct oil spray caused by tapered roller bearings.
- The inner diameter is provided by two robust ribs (10) that provide a smooth sliding during installation and a positive static seal on scratched shaft surfaces.
- The compression spring (11) energizes the sealing lip keeping a constant radial force during life time.

For such applications where the seal is exposed to extremely dirty and wet environments, i.e. heavy-duty tractors, the System 2000 can be also equipped with an additional specially developed HRV seal lip, that looks like an external V-Ring lip sliding against the shaft on the dust side.

■ System 3000

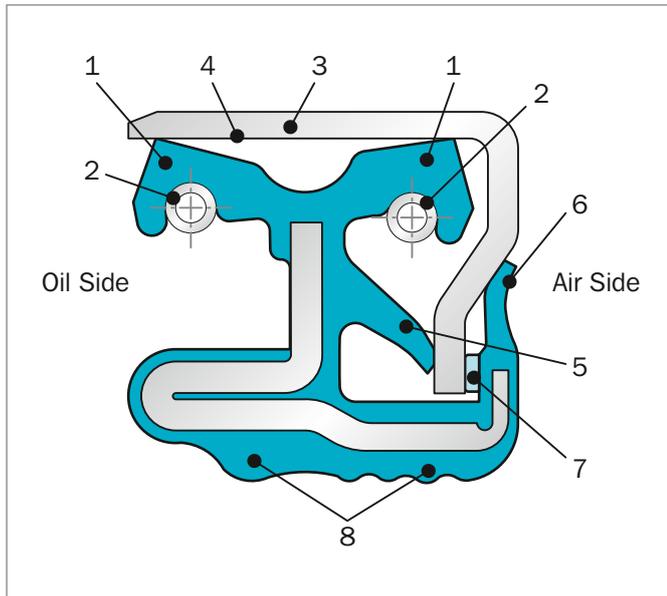

Figure 52: System 3000

System 3000 is a specifically designed Cassette Seal for rotating hubs working in very heavily polluted environments, like tractors operating in rice fields, forestry machinery and dumper trucks operating in quarries and mines.

The design of System 3000 has been specifically developed for long term sealing effectiveness; the internal labyrinth lips have been optimized for friction reduction and flexibility.

Mud-box tests realized in laboratories according to the most demanding customer specifications are showing a significant improvement in life time performance compared to other Cassette Seals. System 3000 has excellent ability to seal in oil while excluding water, dust and mud.

Thanks to its optimized design, System 3000 keeps the same ability to sustain eccentricities, over-pressure and shaft misalignment as standard Rotary Oil Seals.

MAIN FEATURES OF SYSTEM 3000

- System 3000 has tandem energized sealing lips (1) that are stationary against the rotating hub; this feature lets the two lips effectively seal oil and contaminants and are effectively lubricated by the intermediate grease chamber.
- The twin compression springs (2) energize the tandem sealing lips, keeping a constant radial force during life time.
- The outer sealing surface (3) is in close contact with the wheel hub, which gives excellent heat transfer.
- The structure of the sealing counter face (4) has been chosen after several thousand test hours. The position of the sealing lip ensures optimal lubrication.
- Tailored internal axial dust sealing lip (5), has a steady contact with metal counter-face even in case of eccentricity or axial play. It creates a double labyrinth chamber that effectively traps any pollution.
- An external dust-sealing lip (6), is working again with an axial load minimizing in this way friction and wear, and provides the first barrier against contaminants.
- Molded distance lugs (7) locate the sealing element in the right position during assembly of the shaft.
- The inner diameter combines a large rib and multiple smaller ribs (8) in order to provide smooth sliding during installation and secure sealing against scratched shafts.

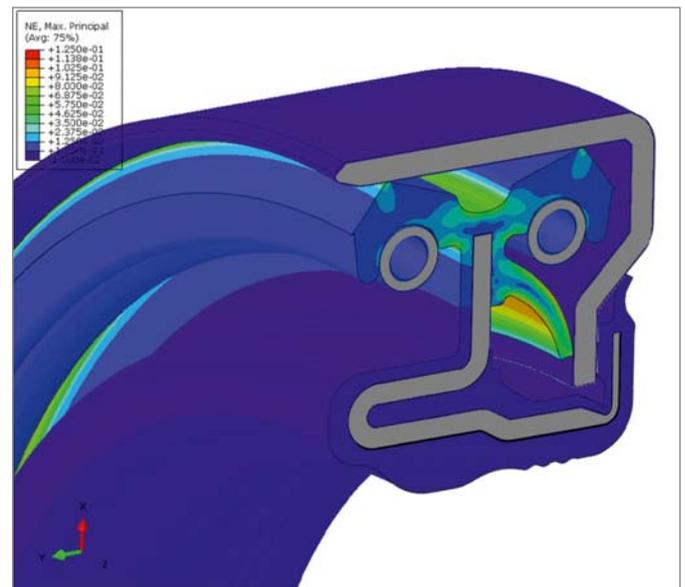

Figure 53: Friction optimization through FEA

■ System 5000

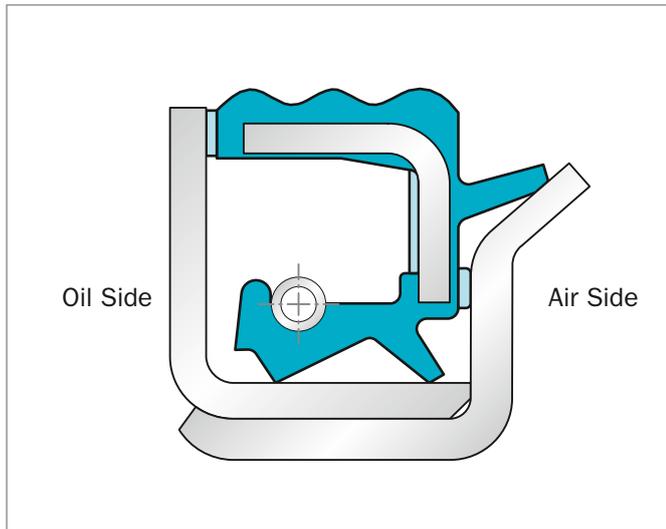

Figure 54: System 5000

System 5000 is, like System 500 and System 3000, a fully enclosed seal, but is designed for rotating shafts. The System 5000 has the same features but the design has been inverted, i.e. the sealing element is fixed in the stationary housing and the casing components rotate with the shaft.

System 5000 is used to prevent oil from leaking out of a bearing housing, i.e. a differential pinion housing for rear axles on trucks, and at the same time preventing road dirt, salt and water splashes from entering.

The design is compact and integrates the necessary shaft counterface as well as providing dirt exclusion. The dirt exclusion function consists of two rubber lips, one axial and one radial, the space between these filled with grease, and the rotating seal case, which acts as an effective deflector due to the centrifugal force.

TURBO-PATTERN - HYDRODYNAMIC SEALING AIDS

TURBO is the Trelleborg Sealing Solutions designation of a range of hydrodynamic sealing aids supporting the sealing function. The hydrodynamic sealing aids are located on the air side of the main sealing lip in the form of ribs or other geometrical shapes. Optimum sealing conditions are attained when a thin film of lubricant is formed so that the lip does not come in contact with the sealing counterface. Such conditions are created by the TURBO-pattern, which brings about a pumping effect. The pumping effect starts at relatively low shaft speed, and is understood as the capacity of the seal lip to pump the media to be sealed back from the air side to the media side.

In order to avoid leakage at standstill or low speed, the TURBO-pattern includes a static edge, which provides a continuous contact line against the counterface. The frictional loss of the seals provided with TURBO-pattern is significantly lower than that caused by seals without hydrodynamic sealing aids. A lower friction does also allow higher-rotary speeds, or provides longer service life.

The Turbo pattern is available in three versions: bi-directional, left hand or right-hand rotation. The standard is bi-directional as most applications have alternating movement of the hub or shaft. If an application has rotation in one direction only, the corresponding left- or right-hand type can be specified. The direction of rotation is always defined as seen from the air side.

■ System CLS 1500

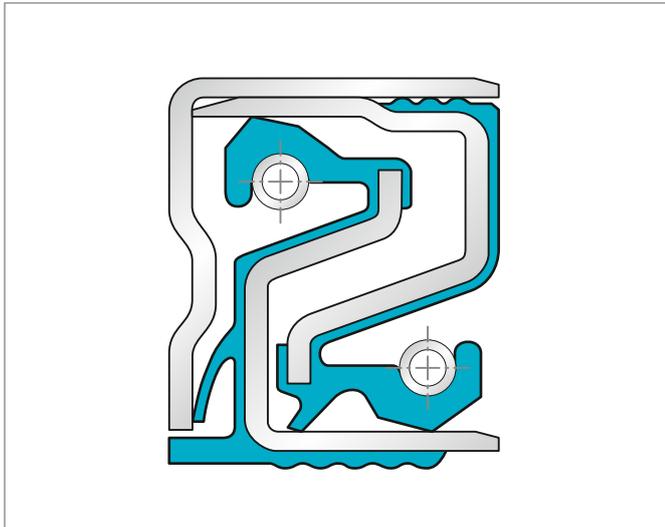

Figure 55: System CLS 1500

CLS 1500 was specially designed for applications in agriculture, vehicle axles, hubs and industrial gearboxes. Its design provides more protection against pollution due to an enlarged space for the grease between the sealing lips, which have also been improved in order to reduce friction and wear.

In the course of this, the oil-side lip based on worldclass standards is open to the oil and thus better cooled.

Design is not only characterized by excellent static sealing and optimized heat dissipation, but also by lower production costs, since crimping and grinding are not necessary.

During assembly, a double metal frame that adds further stability protects the seal from deformation.

Various endurance tests have proven that System CLS 1500 causes no measurable leakage in hot oil tests or any oil contamination in slurry tests. For that reason, System CLS 1500 is a pioneer in enhancing performance in heavy-duty applications.

CLS 1500 is a customized product and will be designed to specifically meet application requirements. Please contact your local Trelleborg Sealing Solutions marketing company for more information.

ORDERING EXAMPLE

Due to various combinations (HRV-additional dirt seal + coating), please contact your local Trelleborg Sealing Solutions marketing company when ordering Cassette Seals.

■ Materials

METAL CASE

The cases are normally stamped of cold rolled steel sheet, EN 10 130 - Fe P04. The high demands on the metal cases, such as high surface finish, free from scratches, call for production using special tools.

COMPRESSION SPRING

For the spring, spring steel SS14 1774 - DIN 17223 - is normally employed. If resistance to corrosion is required, stainless steel SS 14 2331 - DIN 1.4301 is used.

SEALING ELEMENT

The material of the sealing element must be selected according to the working conditions of the seal and the environmental conditions.

Some of the requirements associated with environmental considerations are:

- good chemical resistance
- good resistance to heat and low temperature
- good resistance to ozone and weathering

The functional demands include:

- high resistance to wear
- low friction
- low compression set
- good elasticity

In addition, cost considerations make ease of processing a desirable feature.

No material is available today that satisfies all these requirements. The choice of material is therefore always a compromise between the relative significance of the factors involved.

Trelleborg Sealing Solutions has succeeded in developing a Nitrile Rubber compound (NBR), which exhibits good all-round properties, and for this reason is the compound most commonly used.

The materials normally used for the sealing element are: Nitrile Rubber (NBR), Hydrogenated Nitrile Rubber (HNBR) and Fluorinated Elastomers (FKM).

The additional dirt seal is normally made of Nitrile Rubber. Nitrile Rubber is the basis material for Cassette Seals, as it covers most standard application requirements for general oil- and grease resistance. It is from function and cost aspects the best choice when temperature is not excessively high. Nitrile can be used up to +125 °C in non-aggressive oils. However for long term use, or in aggressive oils, service temperature is reduced to +80 °C.

Nitrile generally has good mechanical properties and the material used for Cassette Seals is optimized for best heat and abrasion resistance.

Hydrogenated Nitrile Rubber is a further development of NBR, where the chemical double bonds in the polymer molecules are saturated with hydrogen. Since the double bonds of NBR are sensitive to heat and ozone, the HNBR will be superior to NBR in heat, ozone and weather resistance. It can generally be used up to +150 °C in non-aggressive media, however for long term use maximum service temperature is +120 °C.

The HNBR for the Cassette Seal is fully saturated and thus well suited for use in aggressive oils. The temperature should however be limited at +120 °C. As saturated HNBR cannot be vulcanized with sulfur, the material has resistance to most hypoid oils up to about +120 °C for long term use.

Low friction and high abrasion resistance are additional typical features.

Fluorinated elastomers give peak performance regarding heat and chemical resistance. They can be used up to +200 °C for long term use and are generally very resistant to oil, grease and fuels. Their ozone and weather resistance is outstanding.

Mechanical and low temperature properties are however lower compared to Nitrile. Thus Fluoroelastomers should be considered only when the material properties are fully used. Some oil additives like amines and high pH-values may damage Fluoroelastomers when used at high temperatures.

TEMPERATURE RESISTANCE

Increasing temperature accelerates the aging of rubber, the elongation decreases, and the compression set increases and finally the material becomes hard and brittle. Cracks at the sealing edge are a typical indication that the seal has been exposed to excessively high temperature. The aging of the rubber has appreciable significance on the useful life of the seal. It can generally be said that a temperature increase of +10 °C (in air) will half the theoretical useful life of the rubber.

Low temperatures are generally not a big problem since the seals themselves generate heat by friction when rubbing against another surface. If the seal has been chilled down, its original properties will return as soon as it is warmed up again. Some leakage may however arise during the start-up phase, before the rubber material is softened by friction heat.

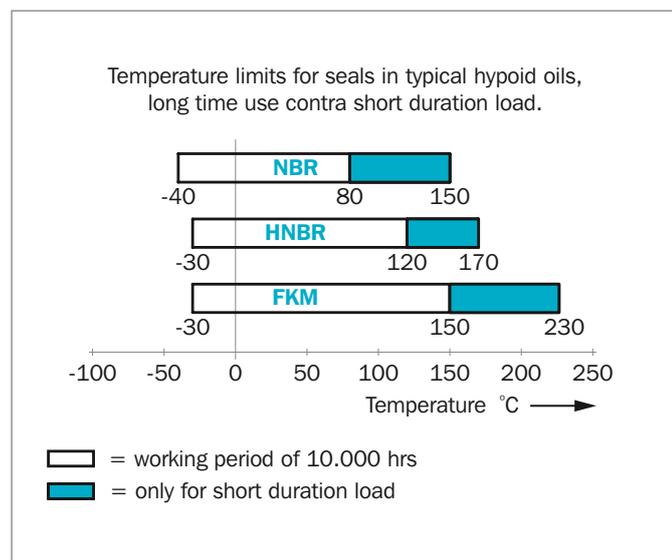

Figure 57: Temperature recommendations in typical hypoid oils

The temperature limits for the standard materials in hypoid oils are illustrated in Figure 57. They should only be regarded as approximate, since the oil type and the time of exposure also affects the materials. The temperature ranges within the shaded areas in the illustrations are temperatures that can be allowed only for certain periods of time. The higher the temperature, the shorter the period of time. At low temperatures, time has no influence on aging.

However, seals are not often working in air as the only media. Temperature limits in combination with other oils and media can be obtained from your local Trelleborg Sealing Solutions marketing company.

OIL RESISTANCE

Innumerable types of oils are available on the market and each of these has a different effect on the rubber. In addition, a given type of oil from a different manufacturer may have a different influence.

The additives in the oil generally affect the rubber. This is the case with hypoid oil, which contains sulfur. Since sulfur is used as a vulcanizing agent for Nitrile Rubber, the sulfur additive in the oil acts as a vulcanizing agent at temperatures above +80 °C. As a result of this secondary curing, Nitrile rubber will rapidly become hard and brittle. Hydrogenated Nitrile and

Fluorinated rubbers, which are not vulcanized with sulfur, can therefore be used for this type of oil, even though the operating temperature may not require these.

Oxidized oils represent another example illustrating the difficulty of tabulating the oil resistance of rubber materials. These oils are oxidized during operation and their properties will therefore change substantially.

Due to the above, no detailed information is given about resistance to certain types of oils. In case of questions or doubt, it is advisable to contact your local Trelleborg Sealing Solutions marketing company who have access to the many years of in-house testing. Additional testing can be carried out in specific oil types provided a sufficient sample is available.

CHEMICAL RESISTANCE

Since the Cassette seals are normally exposed to oil or grease, and not other chemicals, tables for chemical resistance to different media are not included. For guidelines about chemical resistance, please see the Radial Oil Seals chapter in this catalog on page 35 or contact your local Trelleborg Sealing Solutions marketing company.

Application

SYSTEM 500, 2000, 3000, 5000 AND CSL 1500

For the System 500, 2000, 3000, 5000 and CSL 1500, requirements on the shaft finish and hardness are less stringent in comparison with traditional radial shaft seals. A simple fine turning operation gives an adequate surface on the shaft as well as for the housing bore. Diameter tolerances and finish values are shown in Figure 58 and Figure 59.

As the sealing elements have built in counterfaces of their own, no wear on the shaft itself will occur and consequently no hardening of the shaft is necessary.

Suitable lead in chamfers facilitate the installation of the seal.

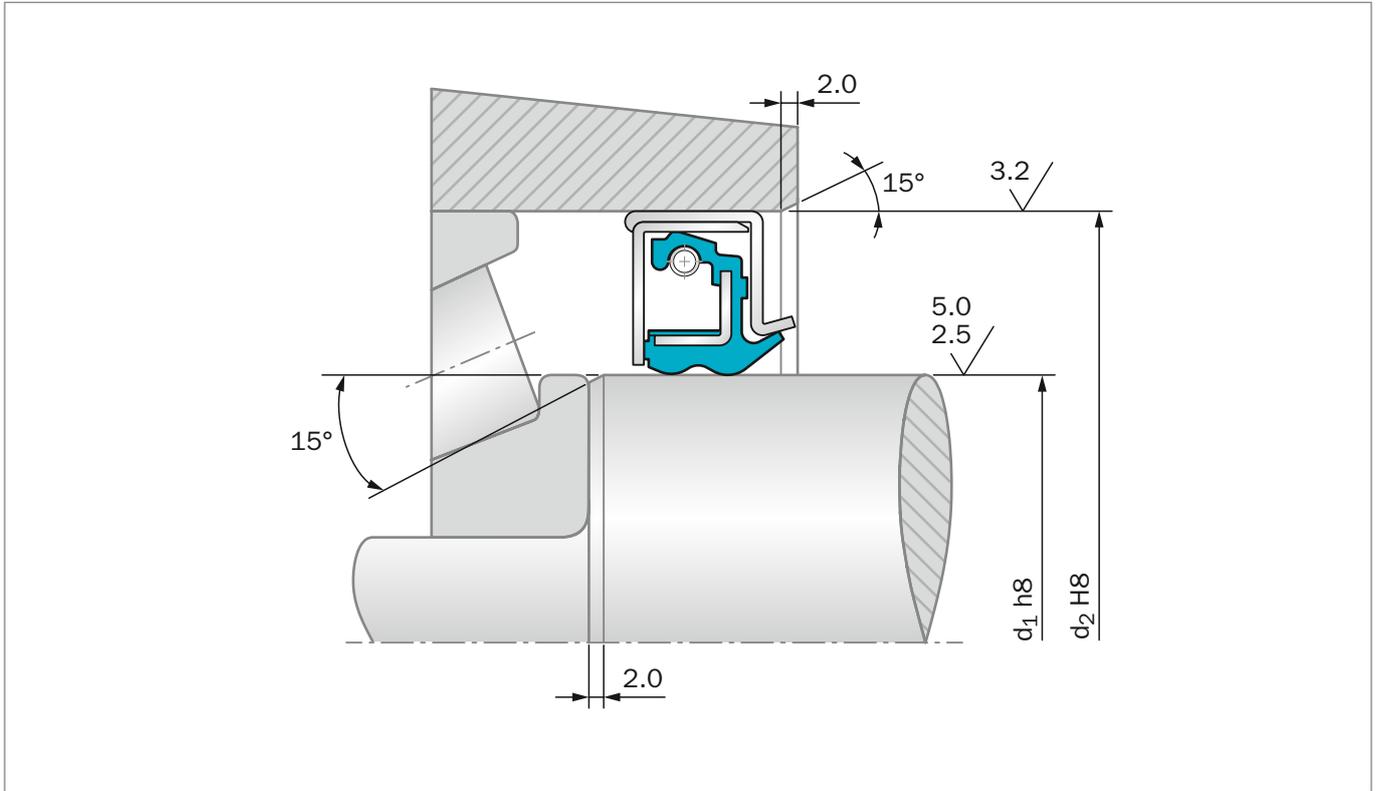

Figure 58: System 500 in wheel hub application (similar for System 2000 and System 3000)

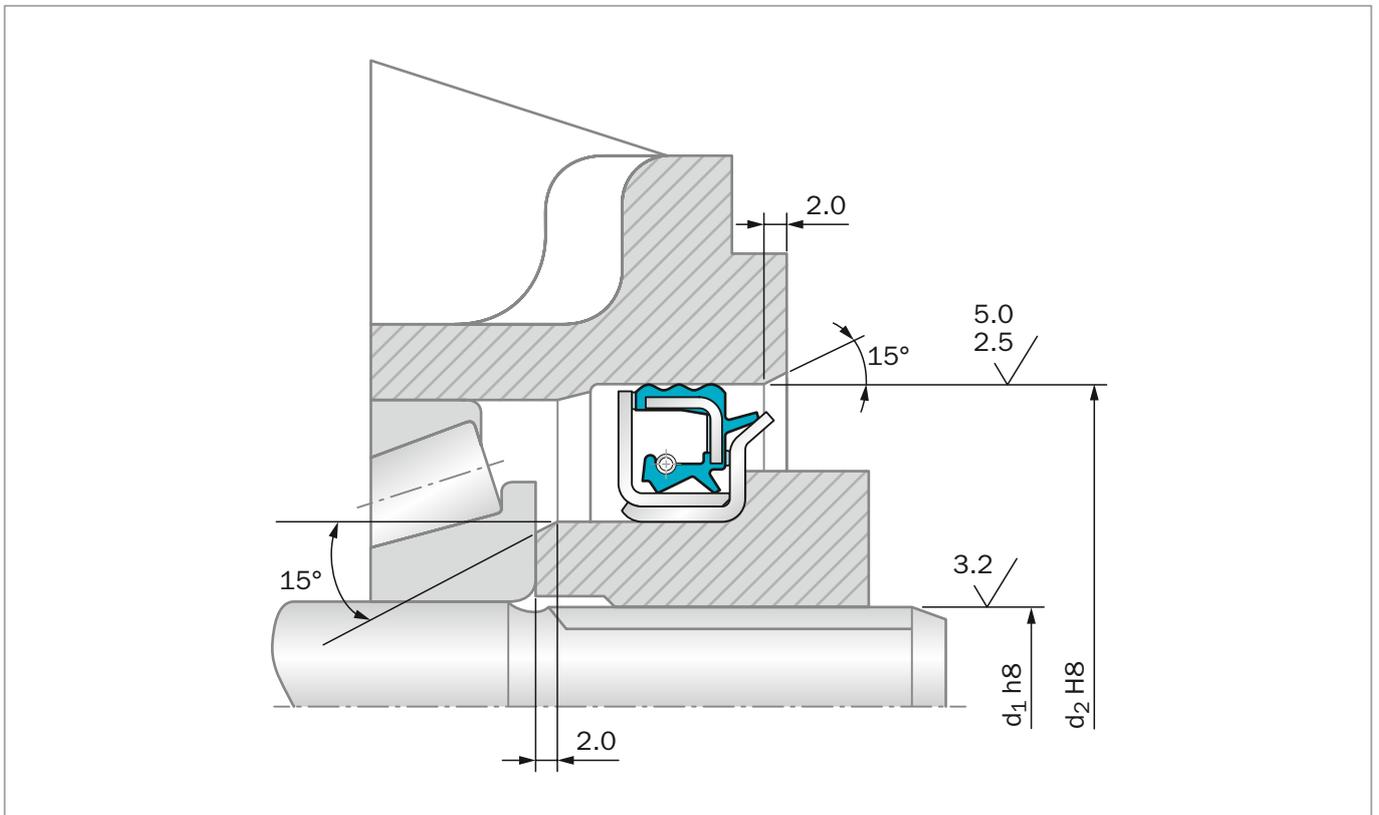

Figure 59: System 5000 in pinion application

SHAFT RUN-OUT

Shaft run-out should as far as possible be avoided or kept to a minimum. At higher speeds, there is a risk that the inertia of the sealing lip prevents it from following shaft movement. The seal must be located next to the bearing and bearing play must be maintained at the lowest possible value.

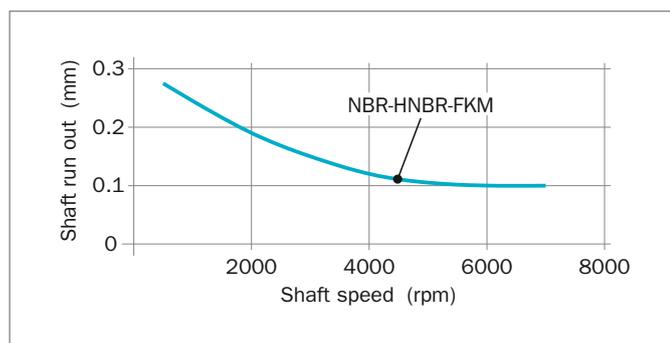

Figure 60: Permissible run-out of the shaft

ECCENTRICITY

Eccentricity between shaft and housing bore centers should be avoided in order to eliminate unilateral load on the lip.

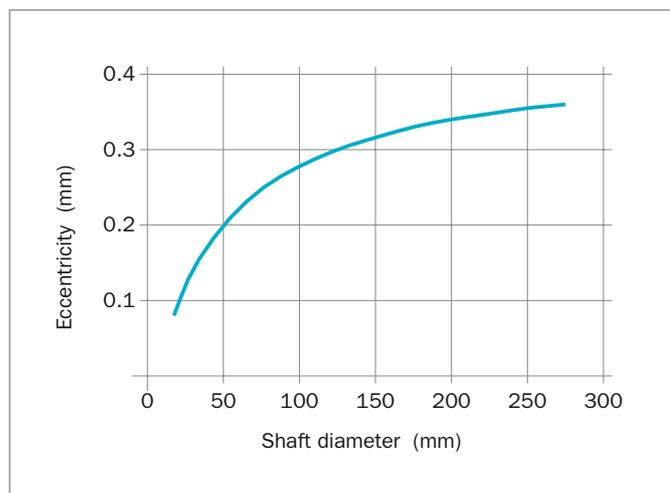

Figure 61: Permissible eccentricity

AXIAL MOVEMENT

Axial movement, including what can be considered as normal bearing play, should be within ± 0.1 mm. The Cassette Seal will function at larger movements, however this may cause larger wear on support lugs and result in shorter lifetime.

PRESSURE

Any difference in pressure from one side of the seal to the other should be avoided. Since the seal is developed for ventilated applications, a pressure difference will in the end lead to decreased lifetime or leakage. In some applications, a pressure difference up to 0.05 MPa could be accepted, but tests should be carried out for each case.

SPEED

The permissible speed of rotation at the sealing point for the various seal designs stated below, assumes normal running conditions, e.g. oil retention and no pressure differential across the seal.

Table 42: Max Surface Speed

Type of Seal	max. Surface Speed (m/s)
System 500	10
System 2000	5

START/OPERATING TORQUE

Due to transferred assembly forces inside the Cassette Seal, the Cassette Seal absorbs higher torque than a standard radial seal. See the Installation section on page 132.

HRV - ADDITIONAL DIRT SEAL

The HRV seal is an all rubber seal. It is designed for use as a complementary seal for the System 500 and 2000 in dirty applications such as off-road. The main sealing is against small particles such as dust, but also dirt and splash. Since the sealing action is axial, it can absorb some axial displacement.

The HRV seal is bonded directly to the outer case of the cassette. The design is similar to the FORSHEDA V-Ring with a body and a flexible conical shaped sealing lip with an integral resilient "hinge" (see Figure 62).

The HRV seal rotates, due to the outer case being press fitted into the bore, and seals axially against a stationary counterface. During rotation the sealing lip rubs against the counterface under a contact pressure calculated to achieve sealing function. The HRV seal also operates as a deflector ring, and its centrifugal action contributes to good sealing.

Due to the centrifugal force, the contact pressure of the lip decreases with increase in speed. The contact pressure also varies with the fitted width.

The counterface for the HRV seal can consist of a suitable surface on the existing hardware or a steel casing adapted to suit the specification for the seal counterface.

The HRV seal:

- seals against outer media like dirt and dust
- has a deflecting function due to the centrifugal force

The requirements on the counterface against which the sealing lip works are rather low. They are more or less determined by the media to be sealed. A finish-turned, polished surface with a surface roughness of Ra 1.6 to 2.0 μm is normally adequate. For sealing against liquid and dirt, Ra 0.8 to 1.6 μm is recommended. However, the character of the surface is of greater importance than the actual surface roughness value. For turned surfaces, it is recommended to buff the surface with fine emery cloth to remove any sharp peaks, which could tear the rubber surface apart and destroy the sealing function, shortening seal life time.

It is also necessary to ensure that the counterface is perpendicular to the shaft, flat and free from scratch marks and other damage within the sealing area. This is especially important when sealing fluids and fine particles.

To achieve the full effect of the deflector action, the HRV seal should be designed in a relatively open space.

The fitted width dimension will be stated on the corresponding product drawing.

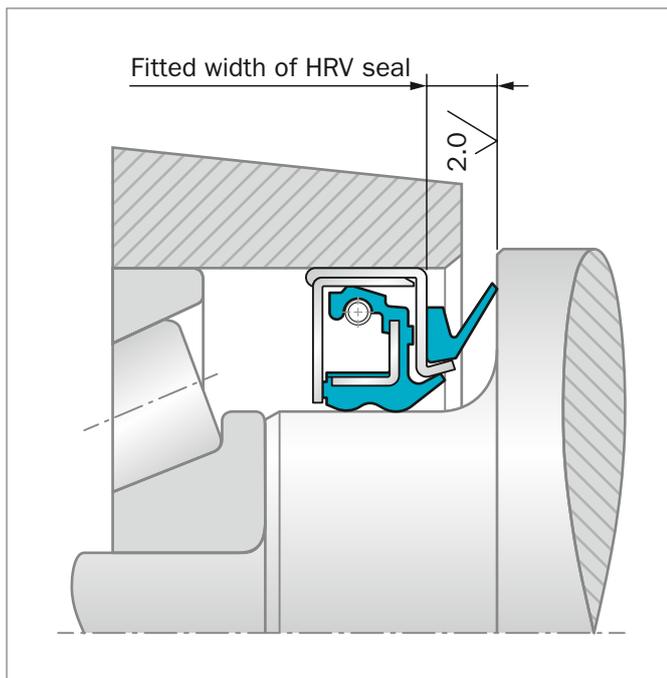

Figure 62: System 500 with HRV seal

■ Installation

As the Cassette Seal incorporates all functions of a seal, shaft counterface and dust protector, there is no need for extra components such as exchangeable shaft sleeves or dirt protection.

This means fewer parts to stock and handle.

When handling and fitting traditional shaft seals there is always a risk of damaging the shaft surface or sealing lips and of improper installation. As the Cassette Seal is fully enclosed, the vital sealing components cannot be touched or damaged during the installation.

SYSTEM 500, 2000, 3000 AND CSL 1500

System 500, 2000, 3000 and CSL 1500 Cassette Seal designs require a high assembly force to push the cassette inside the bore compared with the force needed to push the shaft inside the cassette. As such, the seals must first be assembled in the bore, with the shaft inserted afterwards.

Trelleborg Sealing Solutions recommends following this assembly procedure:

- Ensure the inner surface of the bore and any lead-in chamfers are in accordance with technical specifications and free from any dirt, burrs or scratches.
- Insert the Cassette Seal into the bore using a jig that only makes contact with the metal face of the cassette. Ensure that it does not touch the rubber. Only use a hydraulic piston guided with proper concentricity to the hub. Do not use a hammer or other tool to insert the Cassette Seal.
- The Cassette Seal orientation is indicated by “oil side” or “air side” marked on the seal. Once installed, ensure that the metal face is correctly oriented within the bore.
- Apply pre-lubricating media to the inner rubber surface of the seal. Never use oil or grease as they may reduce the stability of the Cassette Seal on the shaft. If the Cassette Seal is fitted with an optional HRV axial lip, then apply grease to the HRV.
- Insert the shaft or spindle inside the Cassette Seal. The shaft must be driven with proper concentricity to avoid damage. It is recommended to use a hydraulic piston – never use a hammer.

If this procedure is not followed, the Cassette Seal may not function correctly. If this procedure is not possible, contact your local Trelleborg Sealing Solutions marketing company to evaluate alternative assembly procedures.

During the start-up phase with the new Cassette Seal, some leakage of grease and smoke formation may be observed. This is a result of the generation of frictional heat between the metal case and internal rubber support lugs, and does not influence the function and service life of the seal.

When repairing or replacing a Cassette Seal, always use a new seal.

SYSTEM 5000

The System 5000 seal must be installed onto a shaft or a sleeve by a special assembly tool. The seal shall be oriented with the side marked "oil side" facing the inside of the gearbox. The shaft must then be assembled so the oil side of the seal is entering the housing bore.

If the shaft is hollow, the assembly tool should be designed with a guiding column.

For pinion applications on trucks, when a separate end carrier is used, the seal is simply pressed onto the end carrier in a first step of assembling. The end carrier is then entering the splines on the pinion shaft and then a locking nut is used to drive the end carrier and the seal into the right position.

The force required to assemble a System 5000 seal onto the shaft is between 20 to 50 kN, while assembly into the housing bore requires about 1.0 kN. The value of assembly force depends on the surface structure for shaft respecting the housing bore as well as the tolerances. It is recommended to oil the outer rubber covered surface of the seal and also the housing bore to decrease the force necessary for assembly.

During the start-up phase, eventually some leakage of grease and smoke formation may occur. This is a result of the generation of frictional heat between the metal cases and the support lugs of rubber, and does not influence the function and service life of the seal.

If the seal is jammed or damaged in some way during installation, the seal must be replaced before start up.

If the construction is disassembled for any reason, a new seal should be installed.

Further instructions for assembling can be found on separate assembly instruction sheets available from your local Trelleborg Sealing Solutions marketing company.

DISMANTLING AND REPLACEMENT

As all the necessary functions are integrated in the Cassette Seal the complete sealing arrangement is renewed. The shaft to be sealed is unaffected by wear and once it has been cleaned and possible corrosion and dirt have been removed, a new seal can be fitted again.

The Cassette Seal may be provided with a sealant on the metal casing when it is installed into the housing. Take care that the sealant does not flow into the seal or is smeared onto the rubber surface, as this may impede the function of the seal. The sealant can reduce the risk of static leakage due to small imperfections on the surface.

STORAGE

As the service life of bearings and other machine parts depends on how well the seals perform, seals should be handled with caution. Unfavorable storage conditions or improper handling will most likely lead to a change of their physical properties. This can lead to a shortening of life, or failure, for example as a result of hardening or softening, cracking or other surface damages. These changes can be the result of one particular factor or a combination of factors, like oxygen, ozone, heat, light, moisture, solvents etc. Storing the seals under load can lead to permanent deformation of the elastomer. On the other hand, properly stored elastomer products retain their properties for several years.

As the sensitive sealing lips and counter faces are well protected inside the Cassette Seal casing, there is less risk of mechanical damages and influence of dirt and dust in comparison to many other seal types.

CLEANING

If cleaning of Cassette Seal is necessary, use a damp duster and allow the seals to dry off at room temperature.

Solvents, sharp-edged objects and abrasives should not be used.

■ Type APJ – Combined Oil Seal

GENERAL DESCRIPTION

The APJ seal is an assembly composed of a rotary oil seal and a wear sleeve; the rotary oil seal is designed to satisfy customer specifications in terms of shaft speed, pressure, temperature, axial play and chemical compatibility and usually includes supplementary labyrinths and grease packing to prevent contaminant ingress. The integrated wear sleeve has a surface mating with the rotary oil seal, that is properly machined by Trelleborg, removing the need for shaft hardening and grinding. The sleeve can be rubberized or provided by a static sealing coating on the interface with the shaft.

APPLICATION EXAMPLES

- Off-road wheel hubs
- Industrial transmissions
- Robot gearboxes
- Food and chemical mixers

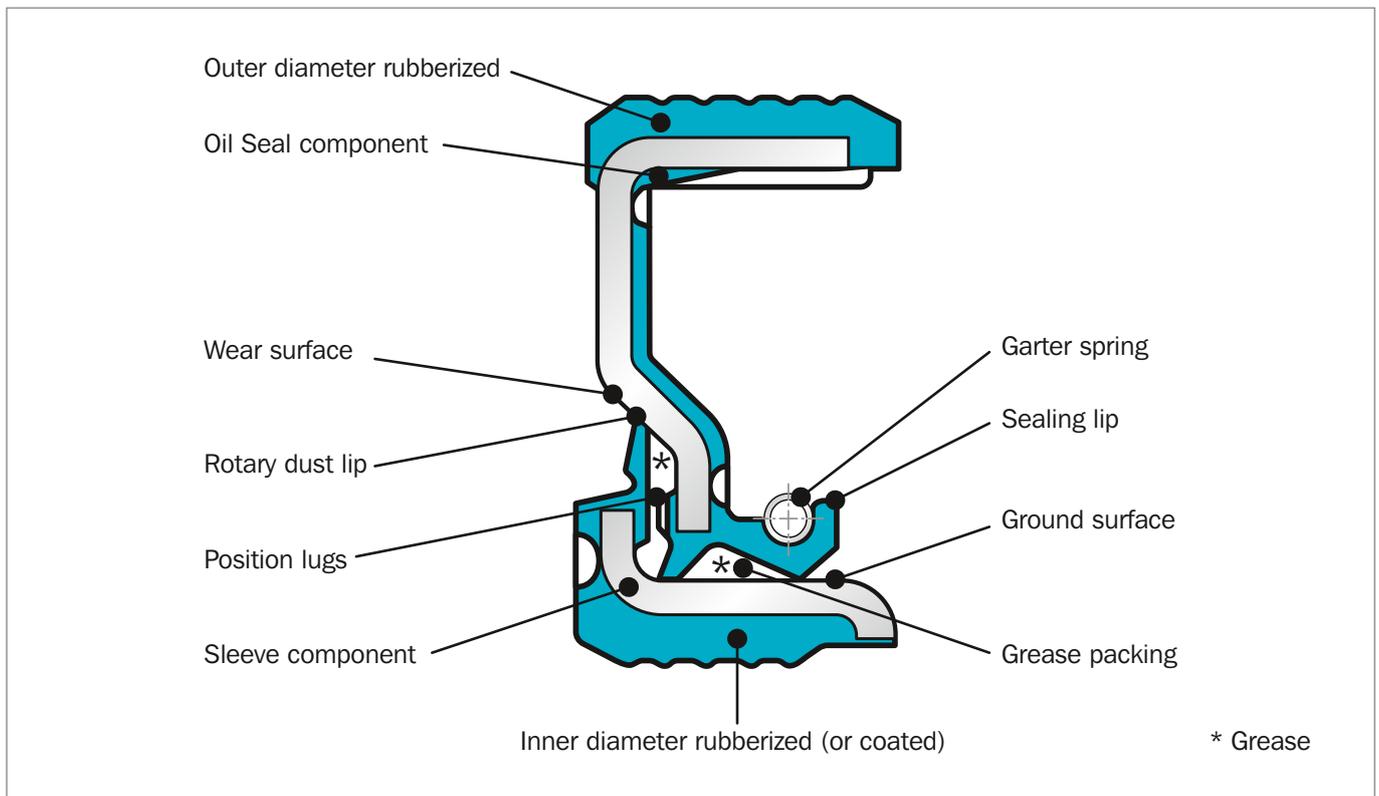

Figure 63: APJ Seal

SPECIAL FEATURES

- The overall geometry of the sealing component and the sleeve are tailored to fit the available space and assembly procedure.
- The APJ is delivered assembled and pre-packed with grease
- The APJ can usually be assembled in the application in two ways, depending on its design and the application design. It can be fitted as a unique component in the bore and in the shaft, or it can be disassembled by the customer, and then the oil seal fitted in the bore and the sleeve on the shaft, providing minimized internal friction.
- According to the type and the amount of external contaminants, the APJ is designed with tailored protection by one or more elastomeric dust lips, having an optimized geometry that can withstand the axial and radial misplacements and generate an effective sealing labyrinth.
- The static sealing between sleeve and shaft can be warranted by a rubber layer, or by a coating sealant; this last design requires less radial space, and provides an optimized dissipation of the heat generated by the sealing lip sliding.

MATERIALS AND CHEMICAL COMPATIBILITY

APJ combined rotary oil seals are designed according to customer specifications, so they can benefit from the broad range of Trelleborg Sealing Solutions elastomeric compounds and any metal required in terms of working temperatures and chemical compatibility.

- The rotary oil seal component can be made from proprietary compounds, for example FDA grades of FPM and EPDM, high temperature and high oil compatibility FKM-XploR, HNBR and NBR, very low temperatures FVMQ and FKM, able to work up to -60°C
- The materials of the metal inserts and of the energizing spring are selected between carbon steel and several grades of stainless steels, according to working environment (for example if there are FDA requirements, or chemical exposure)
- The type of grease used for internal packing is selected according to working conditions; FDA grade is available

End Cover

■ End Cover

■ General Description

End covers are components to be fitted in the housing bores where no input/output shaft is located and to plug and seal service bores. Standard end covers are manufactured in accordance with bore tolerances recommended by DIN 3760 and ISO 6194/1 for Radial Oil Seals.

Two different types of end covers are available as described in the following chapters. The type YJ38 is fully rubber covered and the type YJ39 has a "half-half" design.

■ Type YJ 38

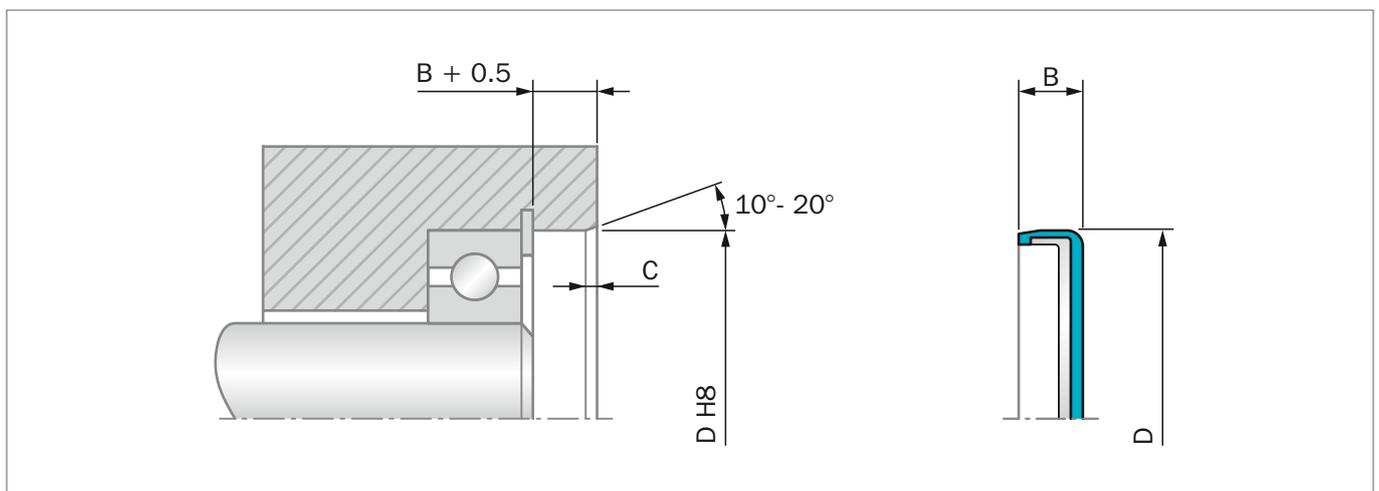

Figure 67: Installation Drawing

ADVANTAGES

- Good static sealing
- Compensation of different thermal expansion
- No risk of fretting corrosion
- Effective protection against air side contaminants
- Higher bore surface roughness is allowed
- Mounting in split-housings

APPLICATION EXAMPLES

- Transmission systems (e.g. gearboxes)
- Machine tool

OPERATING CONDITIONS

Pressure:	Up to 0.05 MPa
Temperature:	-40 °C to +200 °C depending on material
Media:	Mineral and synthetic lubricants (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask for details.

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure and temperature.

Shaft Repair Kit

■ Shaft Repair Kit

■ General Description

The shaft repair kit serves as a running surface for rotary shaft lip seals. It consists of a thin-walled cylindrical tube with a mounting flange (see Figure 69). The flange has a design breaking point and can – if it is an obstacle – be removed.

The shaft repair kit has a wall thickness of approximately 0.254 mm and a spiral free ground surface. It is ideally suited as a counter face for rotary shaft lip seals.

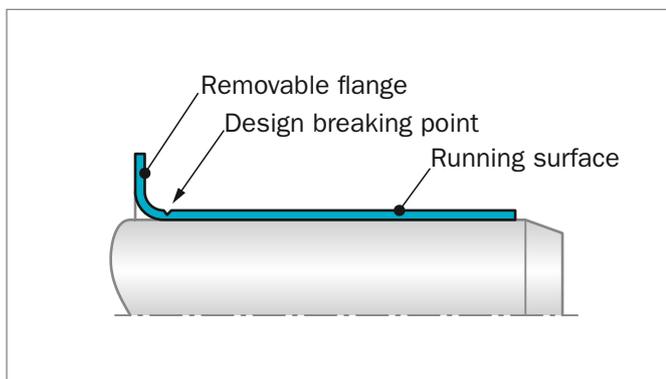

Figure 69: Design of the shaft repair kit

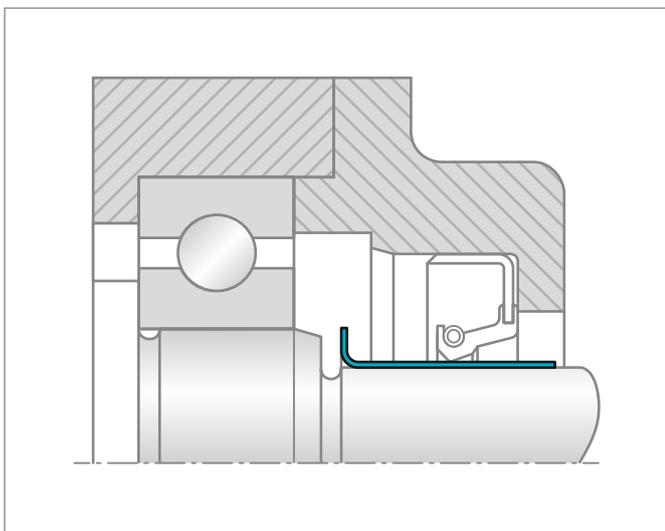

Figure 70: Running surface with shaft repair kit

ADVANTAGES

- Inexpensive replacement of worn shaft surfaces
- Simple and quick installation with supplied assembly tool
- No alterations to the seal dimensions
- Wear-resistant surface for long service life
- Secure seating due to a force fit

APPLICATION EXAMPLES

- Repair of worn shaft surfaces
- Used in new designs to save costs for surface treatment

OPERATING CONDITIONS

Material:	Stainless steel, AISI 304 (1.4301)
------------------	------------------------------------

Material Code:	900 V
-----------------------	-------

Wall thickness:	0.254 mm
------------------------	----------

Surface:	Ground spiral-free (Ra = 0.25 ... 0.5 μm)
-----------------	----------------------------------------------

Hardness:	95 HRB
------------------	--------

INSTALLATION INSTRUCTIONS

The shaft repair kit is fitted using the installation tool supplied. The raised mounting flange and the tool supplied ensure an exact fit.

Together they prevent tilting during installation and thus damage to the sealing surface.

Observe the following points before installation:

- Remove dust, dirt, rust, etc. from the damaged running surface
- Repair deep running scores with filling compound, e.g. metal-filled synthetic resin
- Check that the shaft has a lead-in chamfer

INSTALLATION SEQUENCE

- Check the nominal diameter of the shaft. The oversize to the nominal dimension of the shaft must be taken into consideration
- Place the shaft repair kit with the mounting flange facing forward onto the shaft
- Push on the installation tool
- Push on the shaft repair kit by striking the installation tool with a hammer or use a press
- If necessary, cut the mounting flange using side cutters up to the design breaking point and break off the flange at the line
- Grease the shaft repair kit before fitting the seal

Forsheda® V-Ring

■ Forsheda® V-Ring

■ General Description

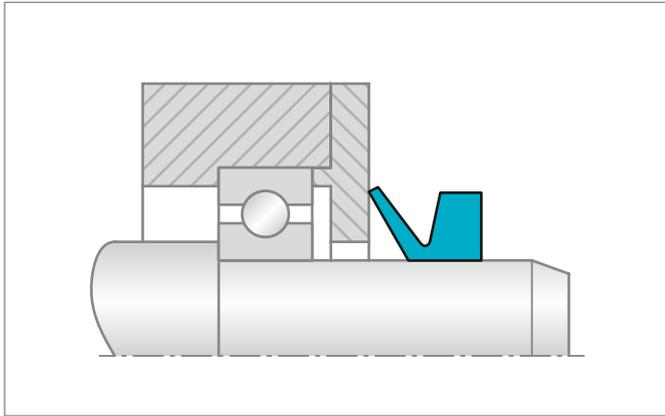

Figure 74: Method of operation of the V-Ring

The V-Ring is a unique all-rubber seal for rotary shafts. Developed in the 1960's by Forsheda AB, it has been used successfully by OEMs and on the replacement market world wide in a broad range of applications.

The V-Ring is the perfect seal to prevent the ingress of dirt, dust, water or combinations of these media while positively retaining grease. With its unique design and performance the V-Ring can be used with a wide range of bearing types. It can also be used as a secondary seal to protect primary seals that do not perform well in hostile environments.

DESCRIPTION AND ADVANTAGES

The V-Ring is normally stretched and mounted directly on the shaft, where it is held in position by the inherent tension of the rubber body. It rotates with the shaft and seals axially against a stationary counterface, perpendicular to the shaft. The counterface can be the side wall of a bearing or a washer, stamping, bearing housing, or even the metal case of an oil seal. The sealing lip is flexible and applies only a relatively light contact pressure against the counter-face and yet is still sufficient to maintain sealing function. The low contact pressure (that varies with the fitted width) allows the seal to run dry in many applications.

Due to influence of centrifugal force, the contact pressure of the lip decreases with increased speed. This means that frictional losses and heat are kept to a minimum, resulting in excellent wear characteristics and extended seal life. Once breakaway friction is overcome, the friction reduces steadily until around the 10 - 15 m/s range, when it reduces quite quickly. In the 15 - 20 m/s range the friction reduces to zero. The V-Ring then serves as a clearance seal and deflector. The power loss due to seal friction develops as shown in Figure 75.

The flexible lip and hinge allow the V-Ring to function even in the presence of a certain amount of run-out, eccentricity and shaft misalignment. Contact your local Trelleborg Sealing Solutions marketing company for advice on these and other application issues.

V-Rings are made entirely of rubber without fabric or sheet metal reinforcement. They are, therefore, particularly easy to install. V-Rings can be stretched and, depending on size, installed over flanges, pulleys and bearing housings without costly dismantling. For larger sizes, they can even be supplied as cut rings and joined by vulcanization on site.

DESIGN

V-Rings are available in seven standard cross-sections to meet various space and application requirements.

The cross-sections of profiles A and S increase with the shaft diameter, whilst the other types have the same cross-section for the whole diameter range.

Profile A is the most common and available for shaft diameters from 2.7 to 2,020 mm, inclusive.

Profile S is wide and tapered, which provides a very firm hold on the shaft. The rings are available for shaft diameters from 4.5 to 210 mm.

Profiles L and LX have narrow axial cross sections making them suitable for compact arrangements and are often used in combination with labyrinth seals. Available for shaft diameters from 105 (135 for LX) to 2,025 mm.

Profiles RME, RM and AX are heavy duty V-Rings that are designed primarily for large high speed bearing arrangements, i.e. rolling mill and papermaking machine applications. Additionally they can be used as secondary seals for heavy duty applications where the primary seal has to be protected against water and or particulate contamination. The RME, RM and AX types can be axially and radially located on the shaft with specially designed clamping bands (see page 162). Available for shaft diameters from 300 mm and up.

Larger V-Ring sizes are available as joined seals. For more details please contact your local Trelleborg Sealing Solutions marketing company.

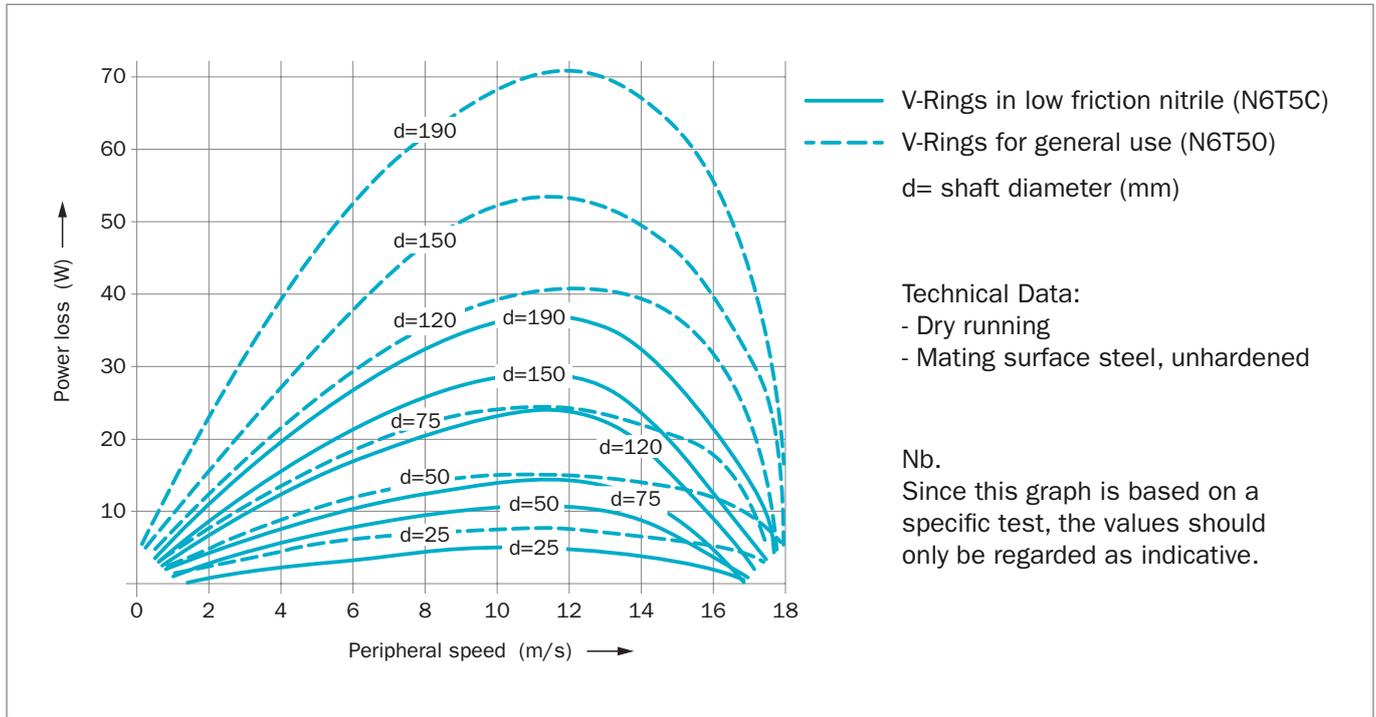

Figure 75: Power loss as a function of peripheral speed for various sizes

Materials

When selecting the correct rubber compound it is necessary to take the following requirements into account:

- good chemical resistance
- good resistance to high and low temperatures
- good resistance to ozone and weathering

It is also necessary to consider the need for the following attributes:

- high resistance to wear
- low friction
- low compression set
- good elasticity

MATERIAL TYPES

The most frequently selected material is the purpose made Nitrile rubber N6T50 which has excellent all round properties.

For applications with temperatures above 100 °C, or in chemically aggressive conditions, V-Rings made of fluorinated rubber (FKM) can be supplied. In fact, a wide range of rubber compounds are available and some of these are listed below.

Table 49: Guide to Selection of Rubber Material

TSS Code	Old Code	Type of Rubber	Characteristics
N6T50	NBR 510	Nitrile	For general use
N6T5C	NBR 562	Nitrile	Low friction
N7T50	NBR 555	Nitrile	Heavy duty conditions. Good tear and abrasion resistance
H7T50	HNBR 576	Hydrogenated Nitrile	Hypoid oils at high temp.
CDT50	CR 415	Chloroprene	For applications in the presence of ozone
E7T50	EPDM 762	Ethylene-Propylene	Good weather and ozone resistance, used with special chemicals such as acetone, ammonium carbonate and benzaldehyde
VDT50	FKM 900	Fluorinated	Very high temperature and chemical resistance
VDT51	FKM 907	Fluorinated	Very high temperature, chemical and wear resistance

Materials highlighted in blue - recommended materials.

TEMPERATURE RESISTANCE

Exposure to higher temperatures accelerates the aging of rubber, the elongation decreases, the compression set increases and finally the material becomes hard and brittle. Cracks at the sealing edge are a typical indication that the seal has been exposed to excessively high temperature. The aging of the rubber has an appreciable negative influence on the useful life of the seal.

The temperature limits for the principal materials are illustrated in Figure 76. They should only be regarded as approximate, since the media and time of exposure also affect the materials.

The temperature ranges within the shaded areas indicate temperatures that can be allowed for only certain periods of time. The higher the temperature, the shorter the service life. If the maximum temperature is exceeded, the elastomer may suffer permanent set or damage. Special elastomers are available for use in cold temperatures. If the elastomer is subjected to temperatures lower than the recommended values it will become hard and brittle, however it will regain its properties as soon as the temperature rises again.

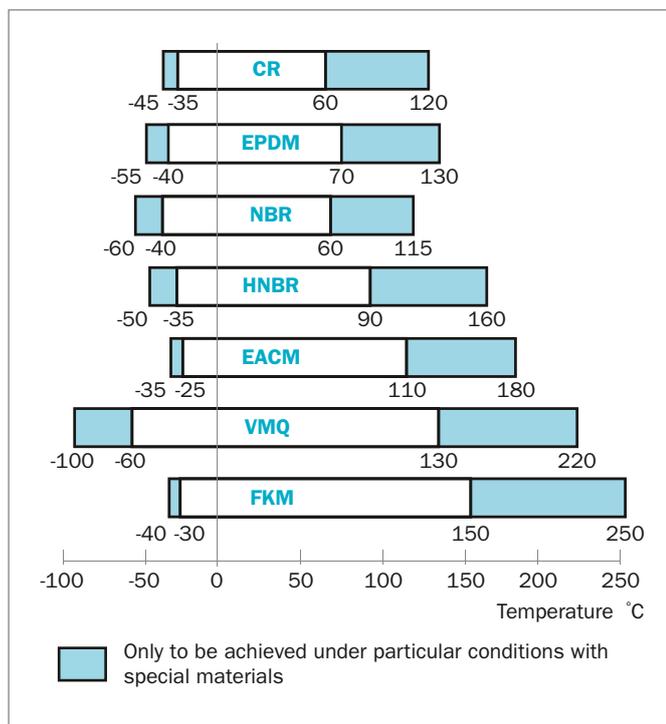

Figure 76: Temperature recommendations for V-Rings

OIL AND SOLVENT RESISTANCE

Since the V-Ring is used primarily for sealing grease lubricated bearings exposed to water splash, dirt, dust, scale etc. the normal choice of compound is Nitrile Rubber N6T50.

However innumerable types of oil are available on the market and each of these has different effect on rubber. In addition, a given type of oil from different manufacturers may have different influence.

It is the additives in the oil that may affect the rubber. Especially so for hypoid oils, that contain sulfur. Since sulfur is used as the vulcanizing agent for Nitrile rubber it will initiate a secondary curing at temperatures above +80 °C. As a result of that, Nitrile rubber will become hard and brittle. Hydrogenated Nitrile and Fluorinated rubbers, which are not vulcanized with sulfur, may therefore be considered for use with this type of oil. Oxidized oils represent another example illustrating the difficulty of tabulating the oil resistance of rubber materials. These oils are oxidized during operation and their properties will therefore change substantially. Such oils break down silicone rubber. Solvents could generally cause deterioration or swelling of the rubber however mixtures of different solvents may cause considerably more damage than a single solvent. An example of this is mixing methanol and hydrocarbons.

For further information on oil and solvent resistance we recommend you to be in contact with your local Trelleborg Sealing Solutions marketing company.

APPLICATION INSTRUCTIONS

The V-Ring is normally fully exposed to the medium to be sealed. The requirements on the shaft and the counterface are mainly dependent on the medium and the peripheral speed.

SHAFT DESIGN

The V-Ring is in most cases fitted on a rotating shaft. The requirements regarding diameter tolerances and surface roughness of the shaft are fairly moderate. As the V-Ring is an all-rubber seal it can be stretched to a varying degree and be used for a wide range of shaft diameters.

In applications where low power loss and long lifetime are important, it is recommended that the V-Ring size is selected, so that the shaft diameter falls between the minimum and nominal values within the recommended range. This is because the contact pressure of the sealing lip increases with the shaft diameter, due to the stretch of the V-Ring. At a higher stretch, a harder contact pressure is generated, causing an accelerated wear of the sealing lip. In order to prevent the V-Ring from sliding along the shaft, and to ensure the correct installation width, it is always recommended to arrange an axial support, especially for small cross-section profiles and larger shaft sizes, for example V-Ring type A, L and LX.

The surface roughness of the shaft should in general not exceed Ra 6.3 µm. For sealing fluids and fine particles, a maximum of Ra 3.2 µm is recommended. Sharp edges and burrs, which can damage the V-Ring must be avoided.

COUNTER-FACE DESIGN

The condition of the counterface has a great influence on the sealing function. The medium to be sealed and the peripheral speed of the shaft determine the requirements regarding surface roughness and material of the counter-face. It is important that it is smooth and flat without any sharp edges. To achieve the full effect of the flinger action, the V-Ring should always be designed in a relatively open space. Equally important is to keep the gap between the shaft and the counter-face as small as possible, in order to prevent entry of the V-Ring lip during the installation. Recommended application dimensions are given in the dimension tables.

MATERIAL AND MATERIAL HARDNESS

Cold rolled steel sheet, stainless steel or zinc plated sheet are excellent materials for the counterface. However, the choice of material is highly dependent on the medium to be sealed.

For normal running conditions, conventional mild steel with a hardness of min. 125 HB is sufficient. For sealing against grease, oil and dry particles no further surface treatment is required. With an increase in speed and the presence of abrasive particles the hardness of the counterface must also be increased.

The following materials are normally used :

Material	Hardness HB	Medium
Mild Steel	125 - 150	Water splash, sand, dust
Grey Cast Iron	190 - 270	Water splash, sand, dust
Sinter Bronze	100 - 160	Water, dust
Stainless Steel (Cr/Ni 18-8, C 0.1%)	150 - 200	Water
Stainless Steel (Cr/Ni 18-8, C 0.15%)	350	Water and abrasive particles
Work-hardened Acid Proof Steel	180 - 200	Chemicals
Tungsten Carbide	350 - 500	Water and scale
Forged Steel	200 - 255	Water and scale
Die-cast Aluminum	90 - 160	Water splash

SURFACE TREATMENT

When the counterface is exposed to water or other corrosive media, it must be protected accordingly. Mild steel surfaces should either be zinc-plated and chromated, chromium plated, treated with an anticorrosion spray, or painted. The choice of treatment will depend on the overall running conditions.

Where the seal is immersed in water, stainless steel is recommended. However, due to the poor thermal conductivity of stainless steel it should not be used in dry running conditions unless the speed is slow (< 1 m/s).

SURFACE FINISH

The rate of abrasion of the V-Ring is influenced by a number of factors, one of which is the surface finish of the counterface. The choice of surface finish will depend on the media to be sealed and the shaft speed as well. It is not only the surface finish value as such that is important, but also the surface character. For turned surfaces, it is recommended to buff the surface with fine emery cloth to remove any sharp peaks arising from the turning operation.

Surfaces with a finish that is too fine, e.g. certain cold rolled steel surfaces, may cause a suction effect between the V-Ring lip and the counterface resulting in noise problems and uneven running (so-called stick-slip effect).

The counterface surface must be free from scratch marks and other surface damages within the sealing area. This is important when sealing fluids and fine particles are present.

GUIDE TO RECOMMENDED SURFACE FINISH

Surface Finish µm Ra	Speed m/s	Medium
0.4 - 0.8	> 10	Oil, water, scale, fiber
0.8 - 1.6	5 - 10	Oil splash, grease, water splash
1.6 - 2.0	1 - 5	Grease, dust, water splash, scale
2.0 - 2.5	< 1	Grease, dust

The surface finish should not be lower than Ra 0.05 µm.

FLATNESS

The flatness of the counter-face is of importance, especially at higher shaft speeds.

The maximum permissible flatness deviation is normally defined as 0.4 mm per 100 mm.

■ Installation

AXIAL SUPPORT

When used to retain oil and grease, an axial support for the V-Ring is always required. For applications with a lower degree of stretch than recommended in the dimension tables (e.g. for ease of assembly) or with a shaft speed exceeding 6 - 8 m/s (depending on the rubber compound selected) an axial support is also necessary.

An axial support can ensure that the correct installation width relative to the counter-face is maintained for blind assemblies.

The V-Ring must always be supported over its entire base. The axial support should be designed in accordance with Figure 77. The dimensions A, c, d_1 , d_3 and B_1 are shown in the dimension tables.

Calculation of the axial support diameter d_5 is as follows;

Table 50: Axial Diameter d_5

V-Ring Type	min. Diameter d_5
A, S	$d_1 + 0.5 \times c$
L, LX	$d_1 + 3 \text{ mm}$
RM, RME	$d_1 + 10 \text{ mm}$
AX	$d_1 + 9 \text{ mm}$

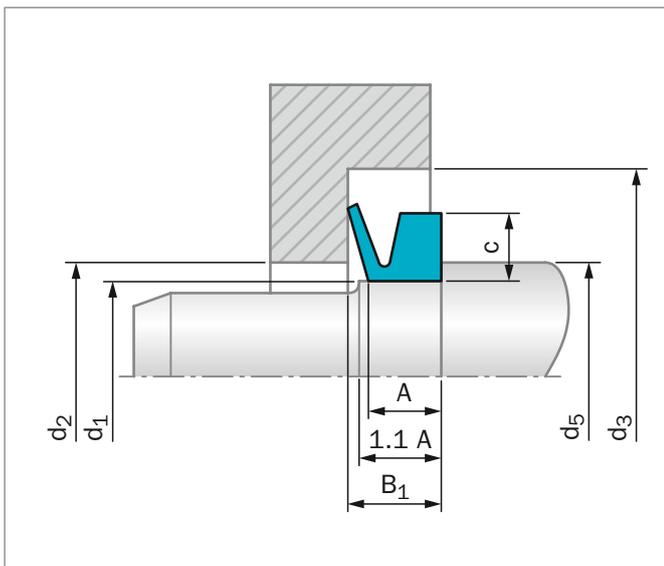

Figure 77: Axial support

RADIAL RETENTION

When the V-Ring is fitted on the shaft, the body of the V-Ring is subject to centrifugal force and tends to move or even lift off from the shaft at a certain speed.

At shaft speeds over 10 - 12 m/s, depending on the V-Ring material, the V-Ring in general requires radial retention. The speed when radial retention is required is also dependent on the degree of stretch of the V-Ring. V-Rings larger than 2,000 mm should always be fitted with radial retention, irrespective of the operating speed.

The radial retention can be designed as a recess, in which the V-Ring body fits, or consist of a number of separate clamping segments. Please contact your local Trelleborg Sealing Solutions marketing company for further guidance.

The clamping band type A or RM are other useful alternatives (see page 162.)

STATIONARY ASSEMBLY

In cases where the peripheral speed of the shaft exceeds 10 - 12 m/s an alternative method to radial clamping is to mount the V-Ring on a stationary component in the unit. The contact pressure of the lip will remain constant, as there will be no centrifugal force acting upon the lip.

In comparison to a rotating V-Ring, friction and power loss will be higher resulting in somewhat shorter service life. In order to compensate for this the following steps should be taken:

Counter-face surface finish:

- machine to max. $0.8 \mu\text{m Ra}$

V-Ring stretch:

- maximum 4 - 6%

Axial interference:

- keep to the minimum requirements for compensation of the axial movement within the assembly.

At higher peripheral speed adequate lubrication and heat transfer from the counter-face are required.

TORQUE

The torque, and consequently the power loss due to the friction of the seal, is often of such a magnitude that it should be taken into consideration when deciding seal type. This applies particularly in the case of small electrical motors, conveyor rollers or any unit where low friction is an important requirement. The power losses are influenced by many factors such as the seal design and compound, surface finish of the counter-face, fitted width and stretch, speed, medium, lubricant, temperature etc.

For this reason it is difficult to give exact torque values for all running conditions.

Generally speaking, the power losses resulting from a V-Ring are always lower than a corresponding Radial Oil Seal. Grease lubrication gives higher power losses than oil lubrication or dry running.

By applying a suitable low friction dry film lubricant on the counterface surface the friction and the heat generated can be reduced.

An increase of the fitted width of the V-Ring, giving a reduced lip pressure, will also lower the friction. However, the total axial movement in the assembly must be considered in order not to exceed the tolerances shown in the dimension tables. Whenever detailed information about power losses is required, consult your local Trelleborg Sealing Solutions marketing company.

INSTALLATION GUIDELINES

When the V-Ring is used as a grease seal/contaminant excluder, the V-Ring is normally mounted on the outside of a bearing housing, with or without, axial support.

General rules:

1. The V-Ring, the counterface and the shaft should be clean
2. The shaft should preferably be dry and free from grease or oil, particularly when the V-Ring is mounted without axial support
3. The lip of the V-Ring should be lubricated with a thin film of grease or silicone oil
4. In cases when friction must be reduced to a minimum, coat the counterface with a low friction agent, and do not apply grease to the lip
5. Ensure that the V-Ring is mounted with a uniform stretch around the shaft

When the V-Ring is mounted on the shaft the outer diameter of the lip is reduced. Unless the stretch is uniform this reduction will vary around the periphery. This may lead to partial entry of the lip in the bore of the counter-face when the seal is pushed into position.

In the case of large diameter seals a uniform stretch can be achieved by inserting a blunt screwdriver or a piece of string under the V-Ring body and running it around the shaft twice. Take care not to damage seal or shaft.

The most convenient method of assembling large diameter V-Ring's, to ensure uniform stretch, is to mark off the body of the V-Ring and the shaft or seating with six equidistant marks. The marks should then be matched together when the V-Ring is fitted in position.

For more detailed installation instructions, contact your local Trelleborg Sealing Solutions marketing company.

CLAMPING BAND

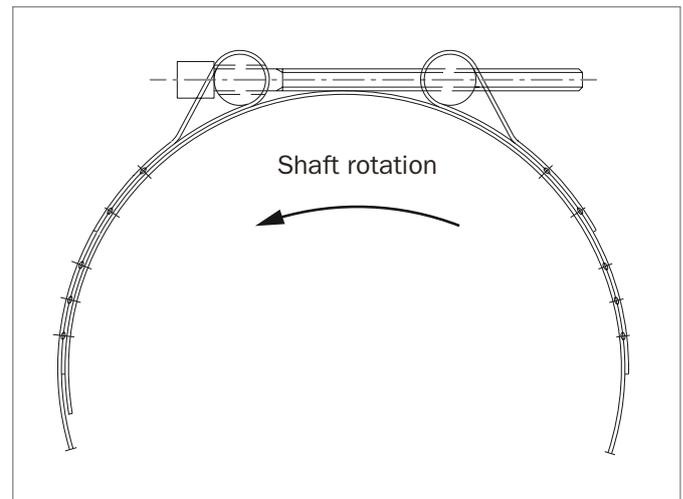

Figure 78: Clamping band RM

CLAMPING BAND RM

For clamping large diameter V-Rings of the RM and RME types, the Clamping Band RM is recommended.

Together with Clamping Band RM a special series of "low stretch" V-Rings can be used for shaft diameters larger than 1,500 mm. This will reduce torque and facilitate the fitting of the V-Ring.

When ordering the Clamping Band RM, simply state the shaft diameter for which the clamping band is intended. Each clamping band is comprised of a set of standard lengths measuring 1,000 mm and 1,500 mm depending on the size, standard attachments and, if necessary, an adjustable length and two set of rivets. When the parts are assembled, the clamping band will fit the specific V-Ring.

All parts are made of acid-proof steel with the exception of the pop rivets, which are made of conventional stainless steel. If operation conditions dictate the use of acid-proof steel, the conventional rivets must be used in conjunction with the adjustable length.

FITTING THE CLAMPING BAND RM

Trim the adjustable clamping band to the right length by using a pair of shears. Rivet the adjustable length and the end attachment together by using a standard pop riveter and the three pop rivets.

Locate the V-Ring in correct position relative to the counterface, i.e. the predetermined B_1 dimension.

Smear the V-Ring with a thin film of grease in the groove designed for the clamping band.

Using the attachments supplied with the band sections, join them together and position the complete band in the body groove with the screw heads facing the direction of shaft rotation. Turn the attachment screws a few turns one by one until the band is tight.

Check that the entire band fits snugly in the body groove.

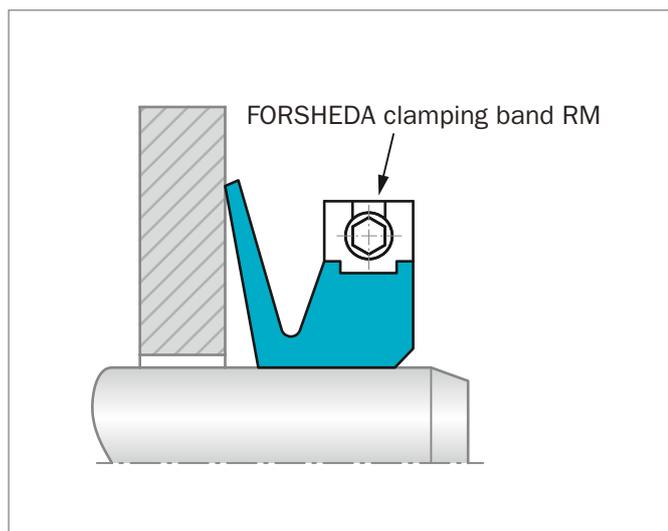

Figure 79: Clamping Band RM

CLAMPING BAND A/AX

The clamping band A/AX is meant to be used with V-Rings type A and AX on shaft diameters from 200mm and larger. The clamping band keeps the V-ring in position both axially and radially and can be re-used several times. The clamping band is supplied in 5m lengths. Screw joints to connect the clamping band as well as the buckle are ordered on separate article number. The band is made of stainless steel AISI 301, the screw joint is made of AISI 304 with galvanized screw. To order the right size and for the correct installation, please contact your local Trelleborg Sealing Solutions Marketing Company.

TSS part numbers for clamping band A

Clamping Band 5,000 mm	XZYDFAE002
Clamping Band RM	on request
Screw joint	XZYDF00022
Buckles	XZYDFAR001

IN-SITU JOINING

To avoid unnecessary downtime and difficult dismantling when carrying out preventive maintenance of process machinery, it is possible to split the V-Ring, fold it around the shaft and join it.

The V-Ring can be supplied either as a complete ring and cut on site, or supplied in the split condition from the factory. For V-Rings types RM and RME it is preferable to split the seals at the factory due to the size of the section.

The best method of joining a V-Ring is by vulcanizing. Portable vulcanizing tools for the different V-Rings profiles, vulcanizing cement and detailed instructions are available from your local Trelleborg Sealing Solutions marketing company.

V-Ring A for a shaft size larger than 2,020 mm can be made to order.

V-Ring Type S

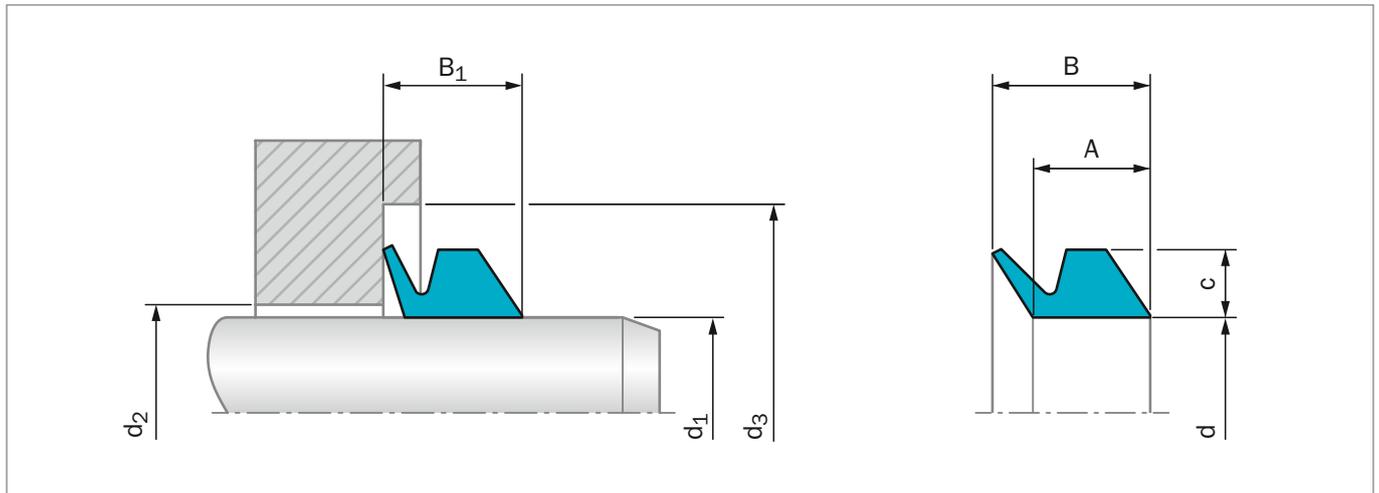

Figure 81: Installation Drawing

When the dimension d_1 is on the boundary between two sizes of V-Ring, select the larger V-Ring. All dimensions in mm.

V-Ring L or LX for a shaft size larger than 2,020 mm can be made to special order.

V-Ring Type RM/RME

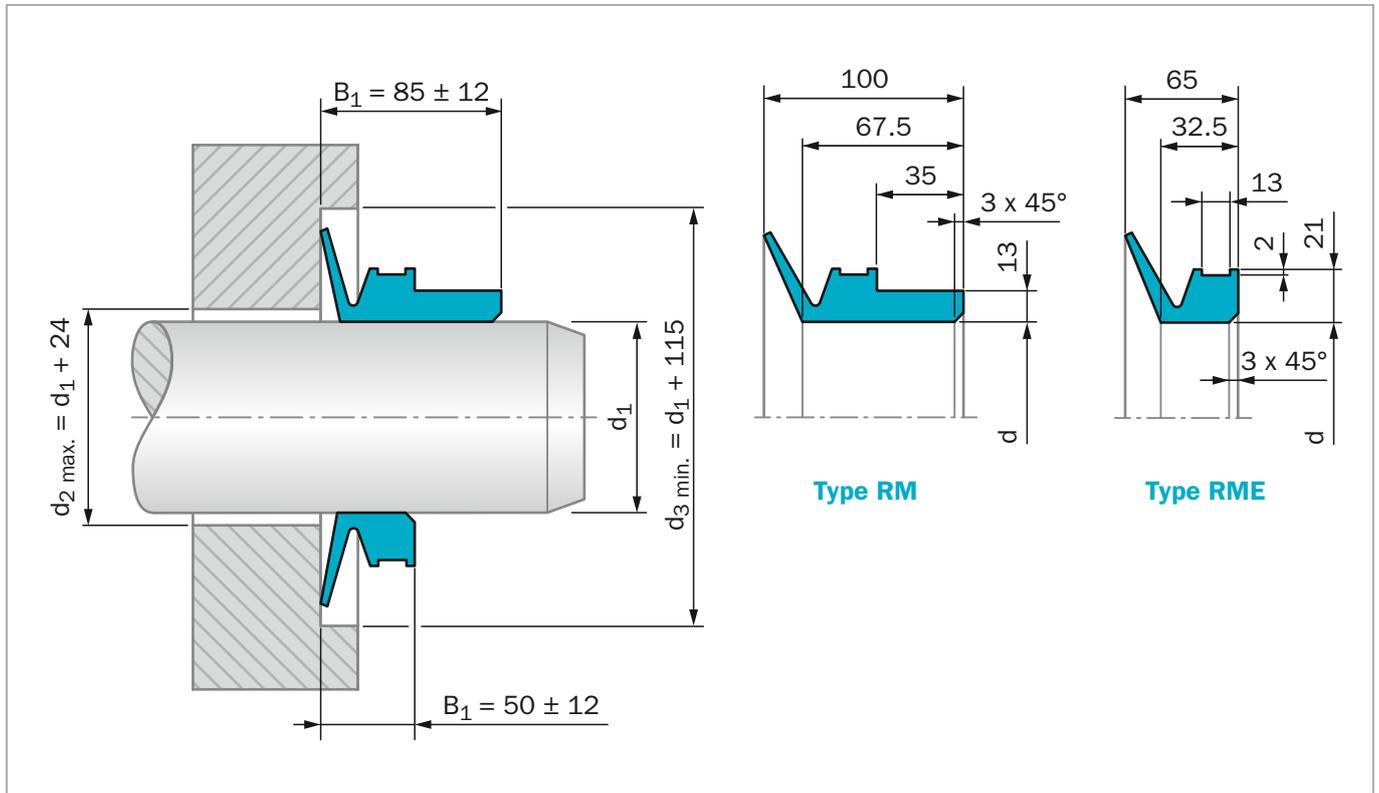

Figure 83: Installation Drawing

When the dimension d_1 is on the boundary between two sizes of V-Ring, select the larger V-Ring. All dimensions in mm.

ORDERING EXAMPLES

Type:	RME, for clamping band, butt-vulcanized for shaft diameter = 500.0 mm
Material:	N6T50 (Nitrile Elastomer)

Type:	RM, for clamping band, butt-vulcanized for shaft diameter = 500.0 mm
Material:	N6T50 (Nitrile Elastomer)

GAMMA Seal

■ Gamma Seal

■ General Description

The GAMMA seal is the result of a large-scale development project covering many years of attempts to combine the capability of conventional mechanical seals to operate at high speeds with the simplicity of the Rotary Shaft Lip Seal. Figure 91 shows the different types, which are characterized by simple design. The basic design consists of two parts, sealing element and metal case. The GAMMA seal is designed to be fixed to the shaft at a pre-determined distance from the sealing surface, which is positioned perpendicularly to the shaft, for example the end wall of a bearing housing. During rotation, the sealing lip rubs against the counter face under a contact pressure calculated to achieve a sealing function. The seal also operates as a deflector ring, and its centrifugal action contributes to good sealing function. Due to the effect of centrifugal force, the sealing lip tends to reduce its contact pressure with increasing speed. As a result, the curve for power loss is very favorable (see Figure 86). At a peripheral speed of around 12 m/s, friction losses begin to diminish and cease completely at about 20 m/s, when the sealing lip has completely lifted free of counter faces. The GAMMA seal then functions as a combined deflector ring and clearance seal.

The GAMMA seal is primarily intended for sealing against foreign matter, liquid splatter, grease.

The foremost features of the GAMMA seal are:

- Very narrow installation width
- Friction diminishes with increasing rotational speed
- Centrifugal action contributes to good sealing
- Lower demands on surface smoothness, surface hardness and tolerances
- Mechanical protection
- Easy to fit

GENERAL DESIGN PARAMETERS

The GAMMA seal permits simple installation design and the requirements on the surface against which the sealing lip works are low. A finish-turned, polished surface with a roughness of 3 - 5 $\mu\text{m Ra}$ is normally adequate. However, the character of the surface is of greater importance than the action surface roughness value. Surface profiles with sharp peaks must be avoided. Injection-molded light-metal alloys can be used in counter faces without further machining. It is necessary to ensure, however, that the part of the mould that produces the counter face is absolutely flawless.

Cold-rolled steel sheet, stainless or zinc plated sheet are excellent materials for counter faces for GAMMA seal. In comparison to other types of seals, the GAMMA seal can better absorb a certain amount of shaft misalignment. It is also relatively insensitive to shaft-to-bore eccentricity and shaft run-out.

Directions of shaft design and fitting are provided in the following sections on GAMMA seal types TBP/RB and TBR/9RB.

GAMMA SEAL TYPE TBP/RB AND TBR/9RB

GAMMA seal type TPB/RB and TBR/9RB consists of an elastic sealing element and a metal case (see Figure 85). The case serves as a holder, support and protection for the sealing element and constitutes a very effective deflector. The components are not bonded to each other, the rubber-sealing element is stretched and held in the case by its elasticity.

Type TBP/RB and TBR/9RB provide a very narrow installation width, which has proved to be very advantageous in certain applications and has permitted this seal to be used in assemblies where other seals could not previously be installed due to lack of space. The seal is press fitted on the shaft, and no other means of fixing is required.

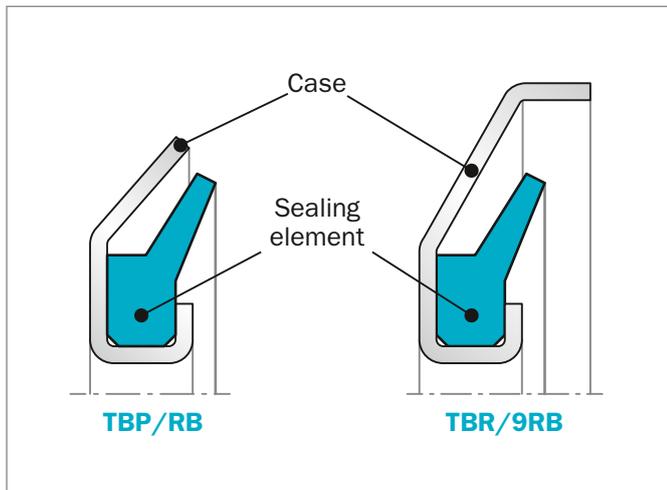

Figure 85: GAMMA seal types

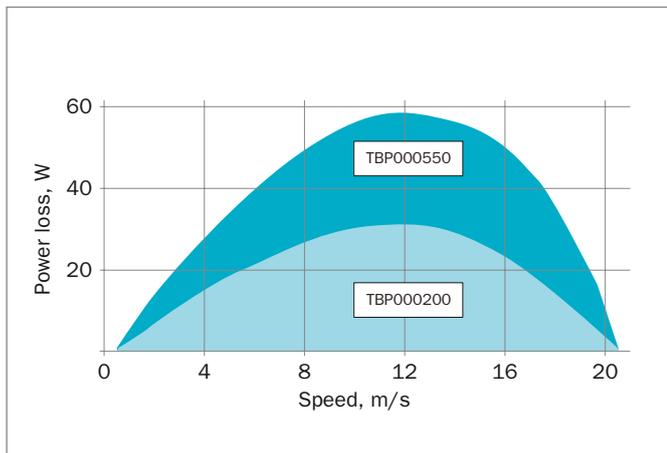

Figure 86: Power loss as a function of peripheral speed
(Counterface 1.5 - 2 μm Ra not lubricated seal)

MANUFACTURING MATERIALS

The sealing element is molded and is normally made of Nitrile rubber with a hardness of 75 ± 5 IRHD. Other compounds can be supplied on request. The case is stamped of cold-rolled steel sheet. In order to ensure a good seal and a tight grip on the shaft, the inside diameter is machined to dimensions which ensure a suitable press fit. The tolerances for the inside diameter of the case are given in Table 57. The case is normally zinc plated. The case can also be made out of other materials, such as, stainless steel.

INSTALLATION DESIGN

GAMMA seal type TBP should normally be installed as shown in Figure 88, i.e. with the seal located in the medium which it is to seal against. As shown in Figure 92 the counter face for type TBR against which the sealing lip works should be designed with a groove for the case extension in order to create the clearance seal. For vertical shafts a design in accordance with Figure 87 is preferred, which effectively will reject impurities and liquid splatter. Shaft tolerance ISO h9 provides a suitable press fit. The shaft tolerances normally used for ball and roller bearings, ISO g6 to n6, can also be used. The seal does not require any other axial fixing other than that which is obtained by the press fit between the case and the shaft.

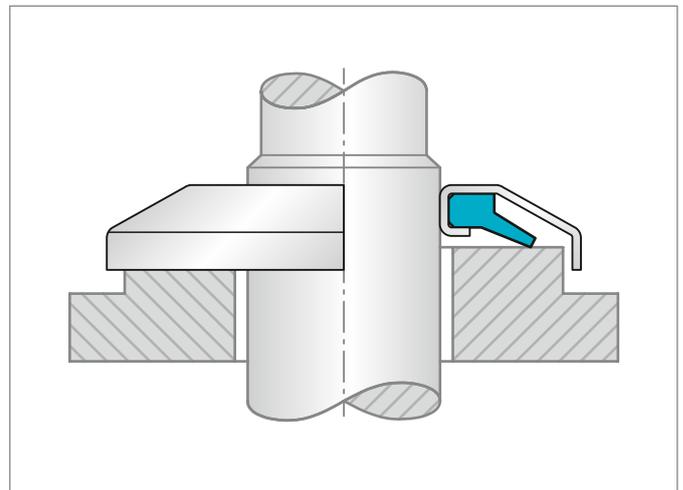

Figure 87: Vertical installation

However, providing a shoulder or a circlip to position the ring may facilitate fitting. The installation dimensions are given in the dimension table.

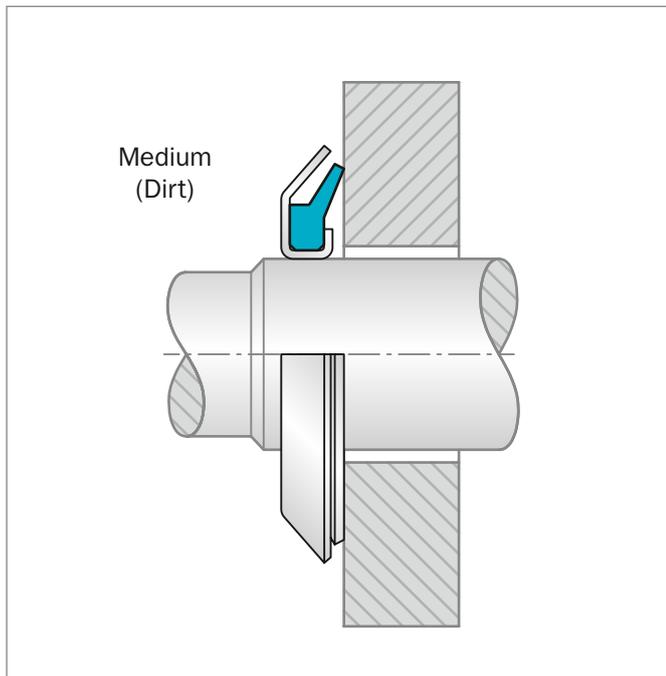

Figure 88: Installation Drawing

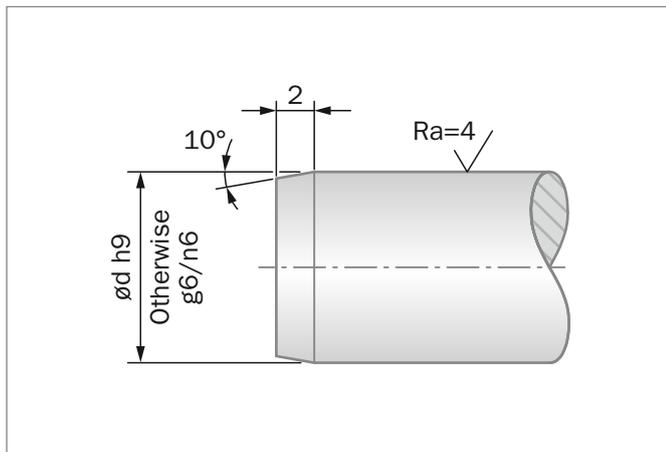

Figure 89: Tolerance of the shaft, surface roughness and chamfer of the shaft

The surface roughness of the shaft should not exceed $4 \mu\text{m}$ Ra. In addition, the shaft should be provided with a chamfer as per Figure 89. Sharp edges or burrs are not permitted. In the case of width b, a variation of $+0.5 \text{ mm}$ is permissible.

Table 57: Lead-in Chamfers

Inside Diameter mm	Chamfer mm	Tolerance mm
0 - 35	2	-0.15 -0.25
36 - 50	2	-0.18 -0.28
51 - 135	2	-0.20 -0.30
136 - 200	2	-0.25 -0.35

FITTING

Prior to being fitted, the sealing member shall be greased, but not between the sealing member and the case. It is important that the seal is fitted with adequate precision. The seal shall be pressed onto the shaft with a uniform and even pressure.

The case must not be tapped directly with the hammer. The seal should therefore be pressed to the right position by means of a suitable assembly tool (see Figure 90, Figure 91 and Figure 92). Since facial fixing beyond the press fit between the seal and the shaft is not provided, the assembly tool should be of a design as shown in Figure 90 and Figure 92 in order to obtain the installation width b as per the dimension tables.

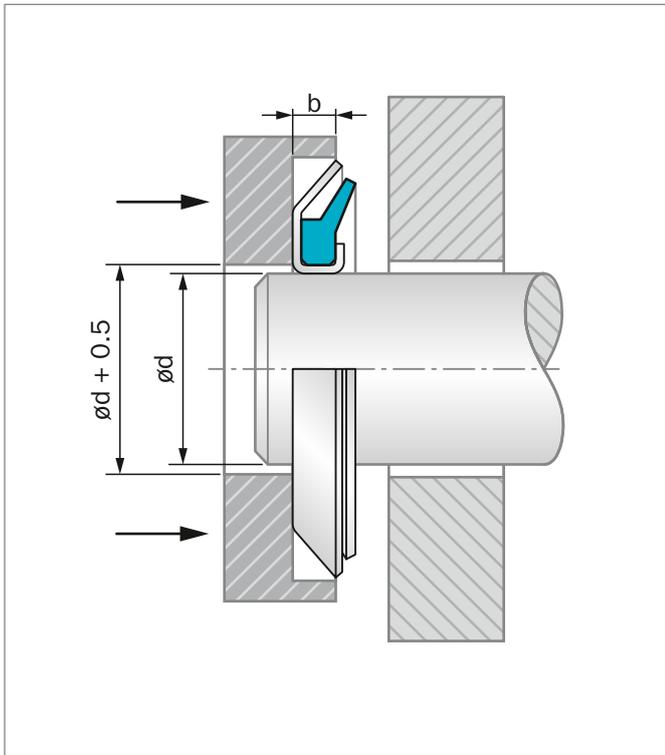

Figure 90: Assembly tool for TBP/RB

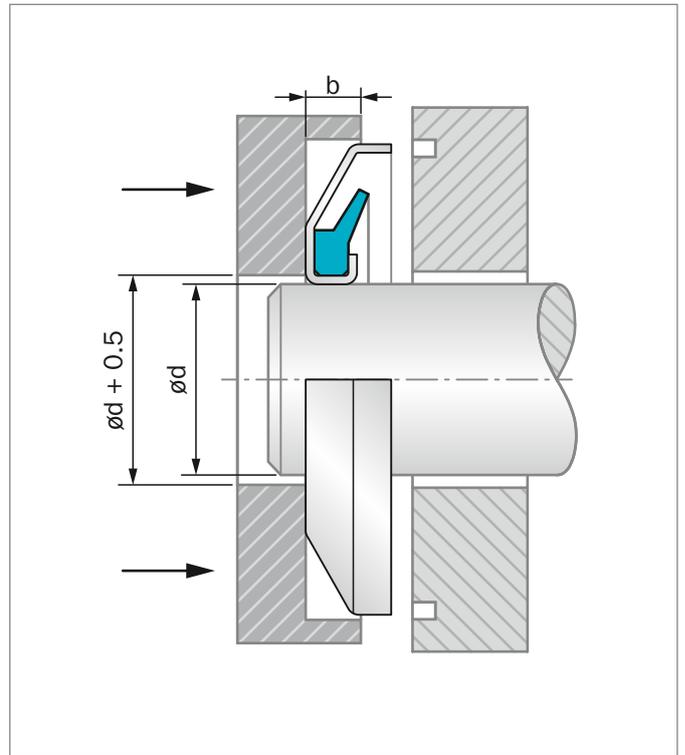

Figure 92: Assembly tool TBR/9RB

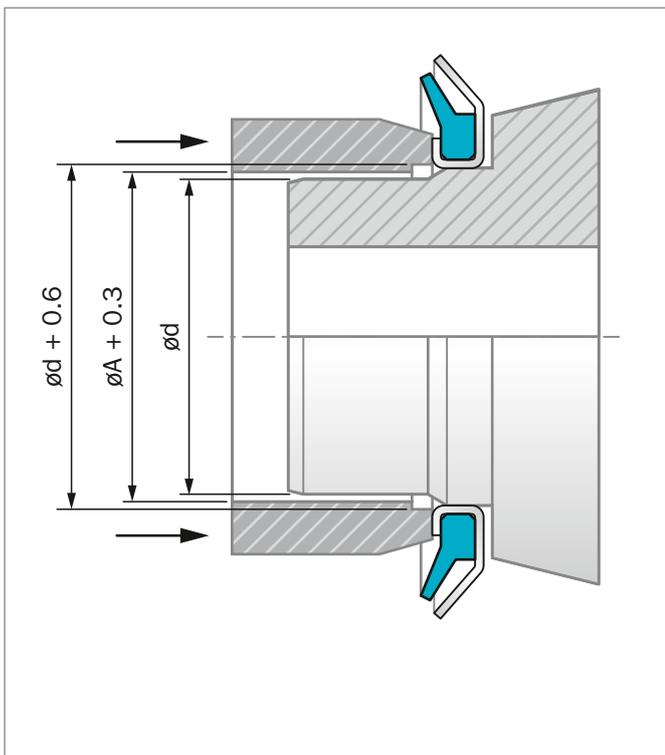

Figure 91: Assembly tool. When positioning the GAMMA seal against a shoulder it is important not to deform the case by pressing with too high load.

■ Type TBP/RB

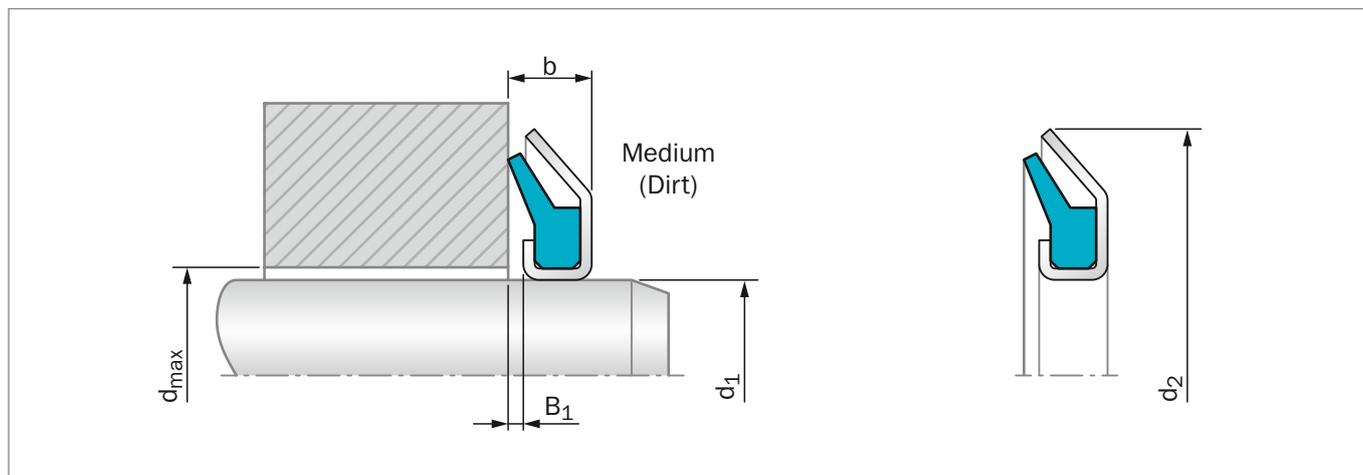

Figure 93: Installation Drawing

GENERAL DESCRIPTION

The design of the most commonly used GAMMA Seal TBP/RB is based on many years of experience in such applications. The total axial force of the sealing lip is given by elastomer pre-stretching together with lip deformation force which depends on the elasticity of the rubber material, geometry of the sealing lip and assembly positioning against the counter-face. The metal shell is protecting the seal from solids and contributes to exclude other pollution media by centrifusion, allowing a good drainage after immersion in liquids.

ADVANTAGES

- Good dynamic sealing
- Very good protection against solid pollution particles
- Modern lip design provides low axial forces (low power loss)
- Small fitting width
- No supplementary retention's needed

APPLICATION EXAMPLES

- Transmission systems (e.g. gearboxes)
- Pumps
- Electrical motors
- Machine tools
- Wheels and heavy-duty axles

OPERATING CONDITIONS

Pressure:	No pressure
Temperature:	-40 °C to +200 °C depending on material
Speed:	Up to 20 m/s
Media:	Mineral and synthetic lubricants (CLP, HLP, APGL etc.)
Housing:	Carbon steel - chromate treated (N7MM) or zinc plated (4N04, 4V04) Stainless and acid-proof steel on request

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask your local Trelleborg Sealing Solutions marketing company for details.

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure and temperature.

■ Type TBR/9RB

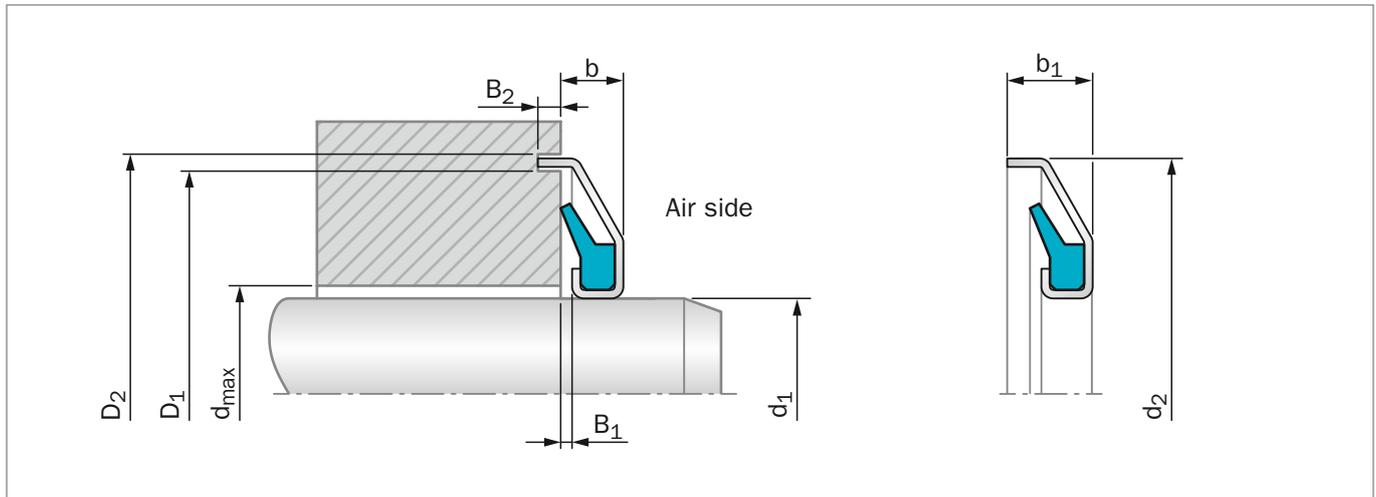

Figure 94: GAMMA seal with labyrinth

GENERAL DESCRIPTION

The design of the GAMMA seal TBR/9RB is based on many years of experience in such applications. The total axial force of the sealing lip is given by elastomer pre-stretching together with lip deformation force which depends on the elasticity of the rubber material, geometry of the sealing lip and assembly positioning against the counterface. The metal shell is protecting the seal from solids and contributes to exclude other pollution media by centrifusion, allowing a good drainage after immersion in liquids. The shape of the metal shell allows a supplementary barrier via the labyrinth in the housing groove which is very effective for heavy-duty applications.

ADVANTAGES

- Good dynamic sealing
- Very good protection against solid pollution particles
- Modern lip design provides low axial forces (low power loss)
- Small fitting width
- No supplementary retention's needed
- Very effective supplementary labyrinth protection

APPLICATION EXAMPLES

- Transmission systems (e.g. gearboxes)
- Pumps
- Electrical motors - mixers
- Machine tools
- Wheels and heavy-duty axles

OPERATING CONDITIONS

Pressure:	No pressure

Turcon[®] Roto L

■ Turcon® Roto L

■ General Description

Figure 95: Turcon® Roto L

The Turcon® Roto L has been designed to cope with increasing requirements of high performance vehicle operators.

An ascending amount of vehicles incorporate a central tire inflation system, where sealing around the axle is required to increase or decrease pressure depending on the surface the vehicle is travelling on.

While conventional seals remain in contact with the axle all the time, Turcon® Roto L only seals when needed, meaning that pressure causes the sealing lip to press against the sealing surface until the pressure is relieved. In case of no activation, the jacket of the seal brings the sealing lip back to its original position, where it is just held against the sealing surface.

This leads to extended seal life as well as reduced friction and lower fuel consumption.

These features are realized through a PTFE sealing lip with a rubber jacket and a stable shape forming metal part.

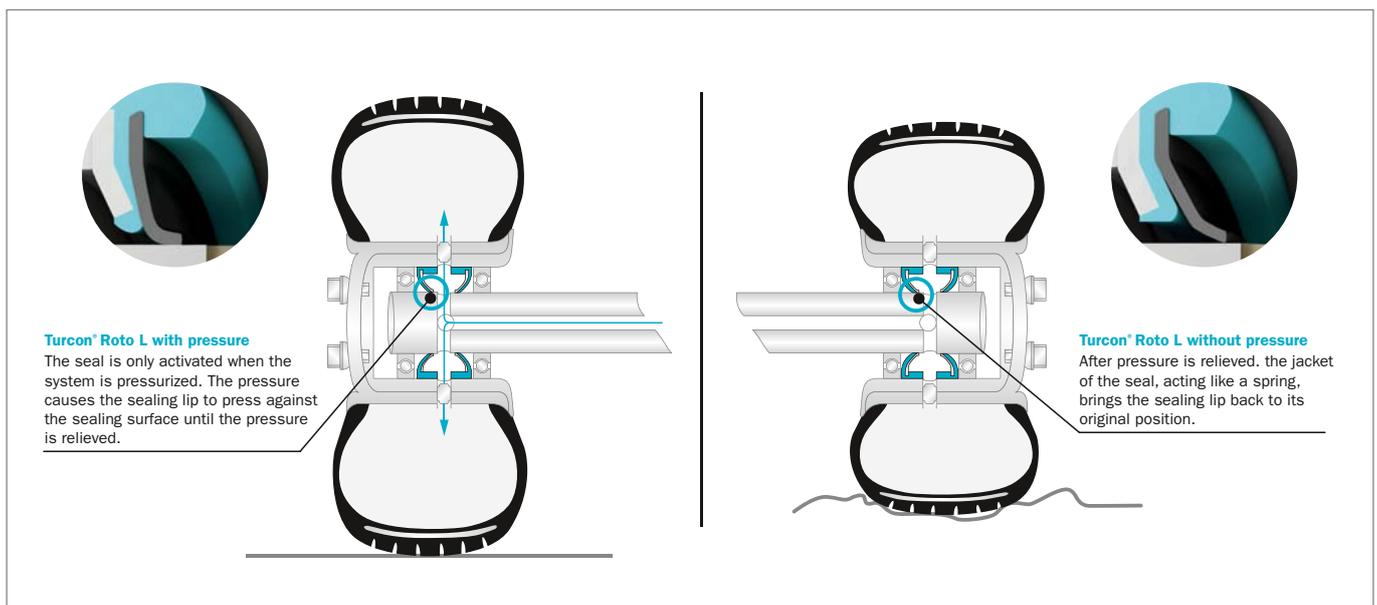

Figure 96: Functional Principle Turcon® Roto L

ADVANTAGES

- Extended seal life on axle systems due to reduced frictional torque (see fig. "Dry air torque test" and "Lifetime of hardware")
- Low friction and suited to short stroke linear movement
- Compatible with all types of hydraulic fluid, especially those fluids with low lubrication performance
- High wear resistance
- Deflation and inflation of tires on the move minimizes down time
- Lower overall vehicle operator costs

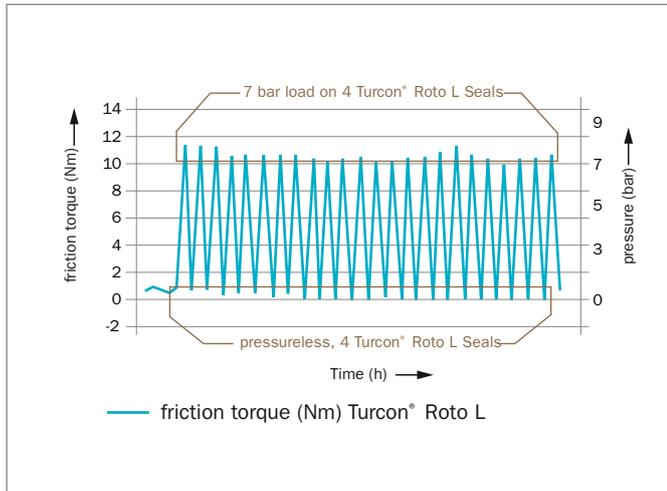

Figure 97: Dry air torque tes

APPLICATION EXAMPLES

- Rotary Applications, e.g. deflation and inflation of tires
- Axle systems
- Transmission
- On- and Off-Highway
- Trucks and Trailers
- Super sports cars

OPERATING CONDITIONS

Pressure:	Up to 1 MPa for standard lip profiles
Medium:	Air
Temperature:	-40 °C to +200 °C (depending on material)

Trelleborg Sealing Solutions has carried out several thousand compability tests. Please ask your local Trelleborg Sealing Solutions marketing company for details.

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure and temperature.

Turcon® M12 from Trelleborg Sealing Solutions is a polytetrafluoroethylene (PTFE) based sealing material whose performance is unrivaled in key hydraulic sealing characteristics, such as friction, wear and high pressure operation.

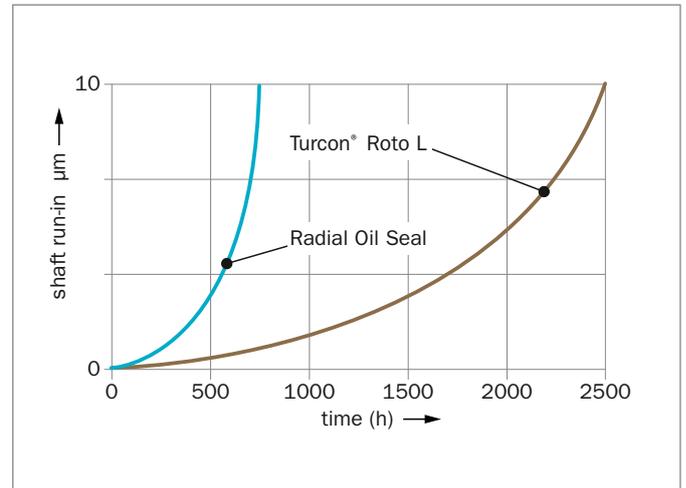

Figure 98: Lifetime of hardware

No other material can give such universally exceptional performance

Extensive testing showed that Turcon® M12 is resistant to virtually all media, including a broad range of lubricants, and has outstanding wear resistance and friction characteristics. This cost-effective material also provides customers with extended seal life, as well as wide operating window in terms of temperature, pressure and velocity. Comprehensive testing has shown that no other PTFE material can give such universally exceptional performance, and Turcon® M12 is now recommended by Trelleborg Sealing Solutions as the material of choice for a wide variety of hydraulic applications.

FEATURES AND BENEFITS OF TURCON® M12

- Resistant to virtually all media including a broad range of lubricants
- Outstanding wear resistance and friction characteristics
- Provides extended seal life
- Operates in wide temperature, pressure and velocity ranges
- Minimal abrasion of hardware, preventing damage to counter surfaces
- Robust for harsh environments
- Good resistance to extrusion
- Reduced environmental impact as it does not include bronze fillers
- Sealing material for universal use in hydraulic applications
- Lower stock holding and fewer items to handle
- Cost-effective solution

Turcon[®] Varilip & HiSpin[®] PDR

■ Turcon® Varilip® PDR

■ Introduction

Turcon® Varilip® PDR rotary shaft seals extend the boundaries imposed by elastomer radial shaft seals by utilizing advanced materials and design techniques to provide the optimum sealing performance for each application. The outcome is a superior sealing solution, which retains a compact seal envelope.

Turcon® Varilip® PDR rotary shaft seals can be used to replace standard elastomeric rotary shaft seals which have a limited application range with respect to temperature, surface speed, media compatibility, pressure or a combination of these due to the inherent limitations of many elastomer grades.

Turcon® Varilip® PDR rotary shaft seals are characterized in particular by the low friction of the Turcon® lip material and their stick-slip-free running, reducing temperature generation and permitting higher surface speeds.

Turcon® has the characteristic of inherent memory, whereby a distorted Turcon® component will attempt to recover to the profile it had during the manufacturing process. This feature is used to help provide the necessary radial loading of the sealing lip onto the shaft, therefore negating the requirement for the energizing spring present in elastomeric seal designs.

Turcon® Varilip® PDR seals are typically the first choice for challenging application conditions. Characteristically, they can be found in applications such as vacuum pumps where both chemical compatibility and ever-increasing performance demands create harsh environments for sealing systems. Turcon® Varilip® PDR seals are also used in compressors where the requirements are long life and the ability to cope with intermittent shaft rotation.

Other market segments where Turcon® Varilip® PDR seals are used include: Chemical process industries, Aerospace, Marine, Motorsport, and Automotive electric drivetrains.

Electrically conductive Turcon® grades are available as special designs for applications where shaft grounding is required to dissipate electrical charge.

Friction optimized versions of Turcon® Varilip® PDR seals are also available as special designs. This design is particularly suited for high peripheral shaft speed and low lubrication levels (mist or splash).

■ Description

Turcon® Varilip® PDR seals are constructed from only two parts – a precision manufactured metal body and a mechanically retained Turcon® sealing element. Unlike seals with pressed metal cases, a gasket is not required to provide sealing between the lip and casing. This is provided by the mechanical retention of the lip, thus improving both the chemical resistance and temperature range of the sealing system.

The mechanical retention of the Turcon® provides a robust product which also eliminates the process of bonding the Turcon® to a metal or elastomer substrate.

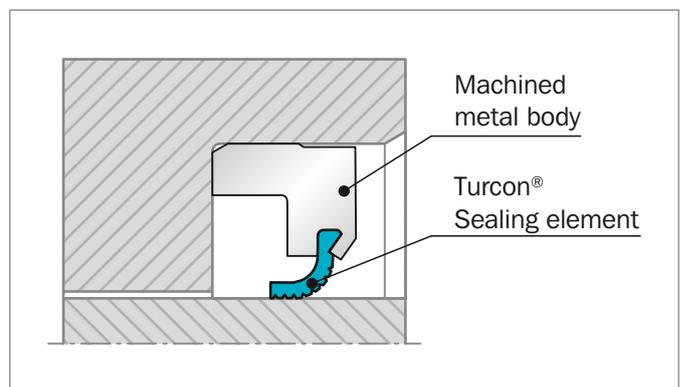

Figure 99: Turcon® Varilip® PDR

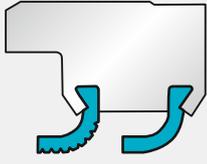

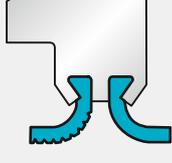

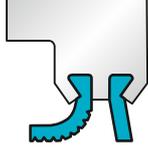

Where required, the Turcon® Varilip® PDR seal is available with a hydrodynamic feature on the Turcon® sealing lip. This provides a positive displacement of the fluid as a result of the shaft rotation to give improved sealing in applications where the shaft only rotates in a single direction. The feature also increases the flexibility of the lip, which allows a wider contact band between the Turcon® lip and the shaft which helps to reduce shaft load and associated friction-related temperature generation.

Turcon® Varilip® PDR Product Range

Turcon® Varilip® PDR seals are available in five basic design styles, detailed in Table 63.

Table 63: Seal Configurations

Seal	Max. Shaft Speed		Max. Pressure		Description
	m/s	ft/min	MPa	psi	
Type A/Type 1 	60	11,811	0.5	73	This is a single lip seal suitable for use in standard industrial applications where an elastomer radial shaft seal would not be able to withstand the temperature, friction, media or poor lubrication conditions.
Type B/Type 3 	40	7,874	0.5	73	The preferred choice for applications in which high seal integrity is demanded or where contaminated media are to be sealed. This type offers a “back-up” sealing lip to provide secondary sealing. Note: Secondary sealing element material is Turcon® M83 in standard seal configuration.
Type C/Type 4 	20	3,937	1.0	145	For use in applications involving higher pressures for which a simple elastomer radial shaft seal can no longer be considered. Due to reinforcement of the sealing lip, pressures up to 1 MPa (145 psi) are possible, e.g. as pump, shaft or rotor seals. Note: Secondary support element material is M83 (not modifiable). Turcon® M83 is the recommended primary lip material.
Type D/Type 5 	40	7,874	0.5	73	For use in applications where the seal is subjected to pressure from both sides and/or applications where the separation of two different media using a single seal is required. Note: Secondary sealing element material is Turcon® M83 in standard seal configuration.
Type G/Type 6 	60	11,811	0.5	73	Similar configuration to Type D / Type 5 but has a non-contacting environmental sealing element rather than a full lay-down lip. This provides effective sealing against the ingress of external contaminants into the system whilst also ensuring torque and resulting power consumption are kept to a minimum. Note: Secondary dust/dirt element material is Turcon® T01 in standard seal configuration (not modifiable).

Note: For shaft diameters from 6 mm to 250 mm, sealing at speeds of up to 90 m/s may be possible with input from Trelleborg Sealing Solutions engineering teams for special designs. Contact your local Trelleborg Sealing Solutions marketing company for more information.

Turcon® Varilip® PDR: Special Designs

Alongside the standard range, Turcon® Varilip® PDR seals are available as special designs to satisfy the demands of specific applications and can therefore accommodate non-standard

housing and shaft sizes. Figure 100 to Figure 105 show some of the special designs available.

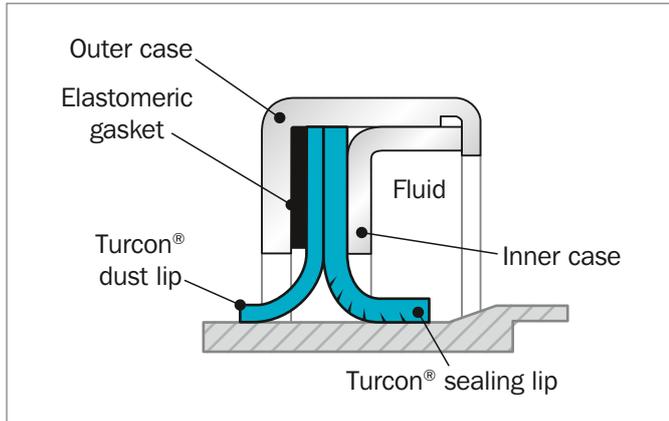

Figure 100: Clamped Design. Suited to high volume applications with excessive housing tolerance.

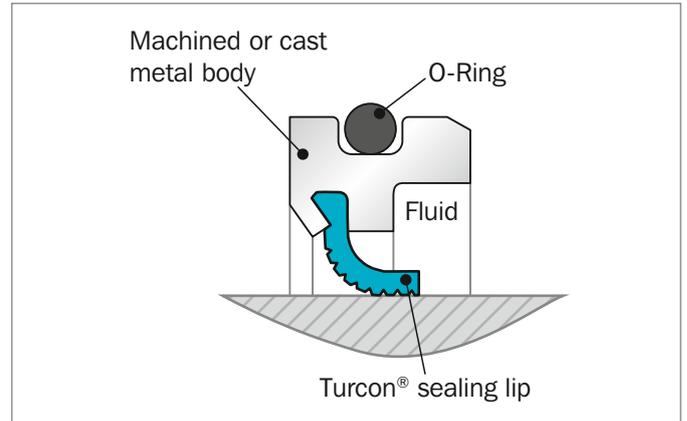

Figure 101: O-Ring Design. For low interference fits in the housing. Housing surface finish > 0.8 µm Ra or particularly searching media control.

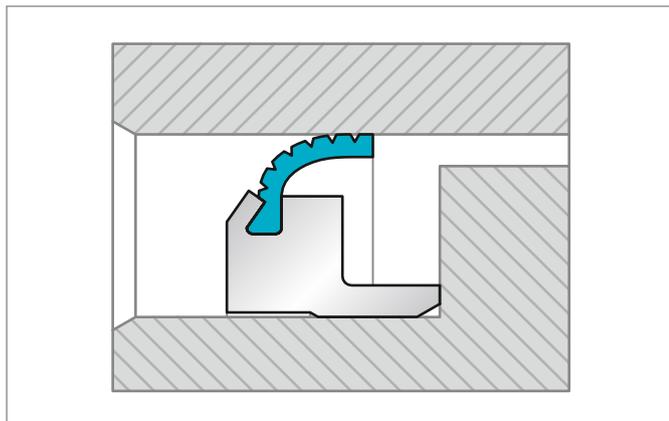

Figure 102: Sealing against the Bore. For applications where the running surface is located on the housing.

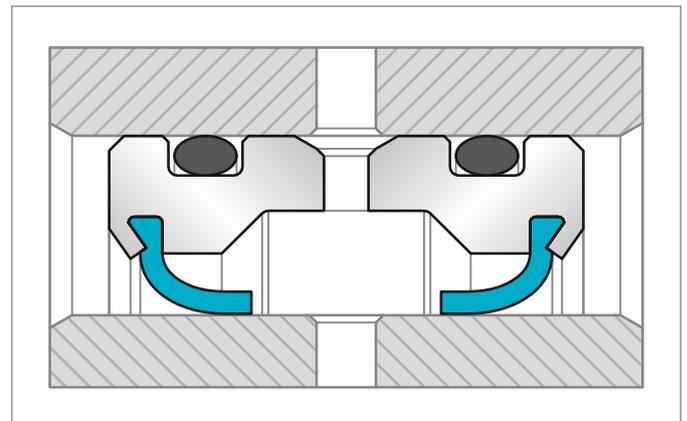

Figure 103: Fluid Transfer. Injection ports enable the transfer of fluid between the housing and the shaft.

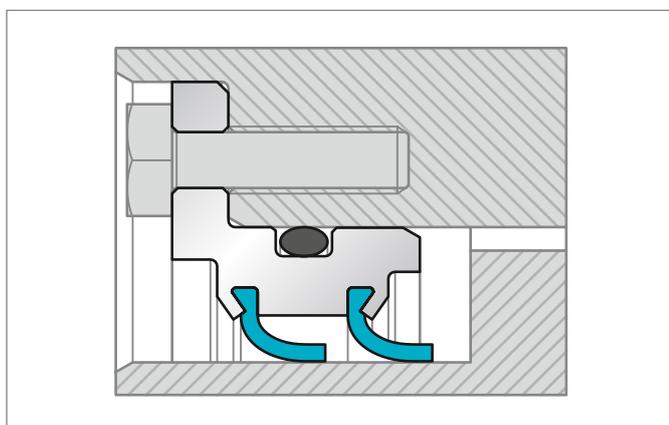

Figure 104: End Plate. Allows for simple assembly/disassembly of the seal.

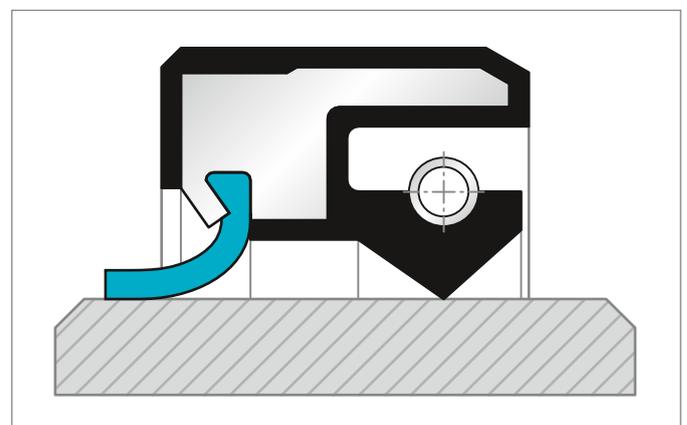

Figure 105: Elastomer/Turcon® Hybrid. This combination utilizes the best attributes of both a Radial Oil Seal and the Turcon® Varilip® PDR.

Materials

SEALING LIP

An important factor for the proper function of rotary shaft seals is the material used for the sealing lip. For this reason, Trelleborg Sealing Solutions has developed a range of specially modified materials based on the proven Turcon® grades. Particular importance is attached to the optimization of friction and wear properties, whilst providing excellent sealing performance, even at high surface speeds. Table 64 gives the materials available for use in Turcon® Varilip® PDR seals. Additional compounds have been developed for specific applications which are available on request. Designs with more than one sealing element will use Turcon® M83 as the standard secondary lip material to make use of its superior dry running

capabilities. Adding the “M” material code will override the standard secondary lip material selection and replace it with the selected primary lip material. The dust lip will always be a low abrasion-resistant, virgin PTFE to allow rapid sizing of the lip inner diameter relative to the shaft and provide a close clearance barrier.

MATERIAL CODE EXAMPLE:

“T251M” as a material code suffix = Both sealing elements Turcon® T25. See full ordering examples on Page 224, Table 76 and Table 77.

Table 64: Sealing Element Materials

Material Code	Standard Material Configuration (Type B, C, D, G)		“M” Material Code	Mating Surface Hardness
	Primary lip Material, Applications, Properties	Secondary Lip		
Turcon® T25 Standard material with exceptional wear and friction characteristics For lubricated running, e.g. oil, grease Glass fiber, lubricant-filled PTFE Color: Gray	M83	T01 (Virgin PTFE)	T25	Min. 55 HRC At low pressure and up to 4 m/s (788 ft/min) Min. 45 HRC
Turcon® T40 For all lubricating and non-lubricating fluids, especially water Used for medium hardness shafts in applications where there is risk of shaft wear Carbon fiber filled PTFE Color: Gray	M83	T01 (Virgin PTFE)	T40	Min. 55 HRC
Turcon® T78 Particularly good running behavior permits the use with dry running or poor lubrication, and in conjunction with soft shaft surfaces e.g. Stainless Steel shafts in food, pharmaceutical and chemical industries. For pressure up to 0.2 MPa (29 psi). Aromatic polymer filled PTFE Color: Tan or dark brown	Not available Must order with “M” designation	T01 (Virgin PTFE)	T78	Min. 170 HB

Table continues on next page

Material Code	Standard Material Configuration (Type B, C, D, G)		“M” Material Code	Mating Surface Hardness
	Primary lip Material, Applications, Properties	Secondary Lip		
Turcon® M83 Specially designed for dry-running applications. Particularly good results in applications for the semiconductor industry. Can also be used lubricated Glass fiber and pigment filled PTFE Color: Yellow	M83	T01 (Virgin PTFE)	N/A	Min. 60 HRC
Turcon® MF5 Specially designed for dry-running applications. Can also be used lubricated. For food contact service Glass fiber-filled PTFE Color: White	Not available Must order with “M” designation	MF1 (Virgin PTFE)	MF5	Min. 60 HRC
Turcon® MF6 Especially suited for low pressure rotary applications and running against soft surfaces. For food contact service PEEK-filled PTFE Color: Tan	Not available Must order with “M” designation	MF1 (Virgin PTFE)	MF6	Min. 170 HB

METAL BODY

Turcon® Varilip® PDR seals are available as standard using the materials shown in Table 65. Other specialised materials are available on request.

Table 65: Metal Body Materials

Code	Material
1	Stainless Steel 304
2	Stainless Steel 316
3	Unavailable
4	Mild Steel (Zinc Plated)
5	Aluminum (Industrial)

■ Technical Data

SPEED

The graph in Figure 106 shows the superior surface speed capability of Turcon® Varilip® PDR compared to elastomeric shaft seals.

The operating speed directly impacts the temperature generated by the seal, which is an important factor when considering the requirements for the sealing system (See Figure 108 and Table 66).

The limiting speed will be dependent upon the temperature, pressure, media, lubrication properties, heat dissipation and the shaft condition.

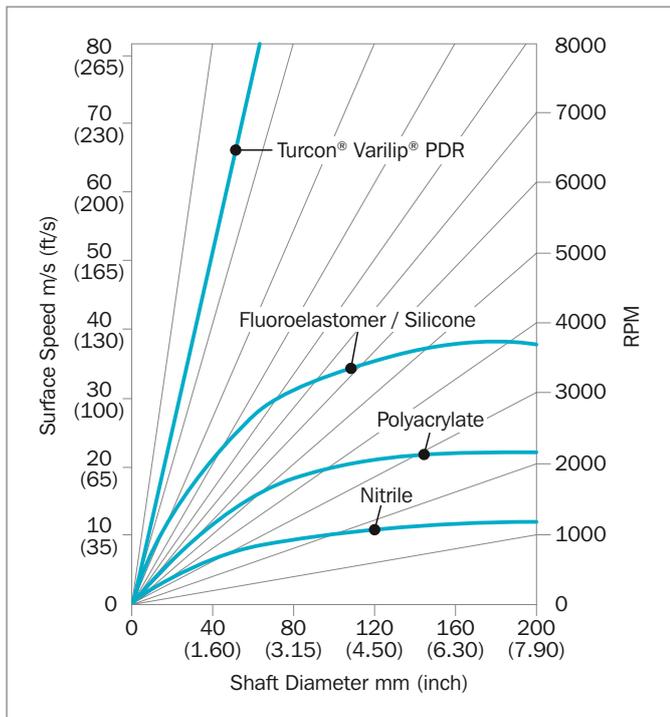

Figure 106: Surface speed as a function of shaft diameter and RPM

Table 66: General Recommended Maximum Surface Speed

Material	Max. Surface speed	
	m/s	ft/min
Turcon® Varilip® PDR	100	19,680
Fluoroelastomer	38	7,500
Silicone	38	7,500
Polyacrylate	22	4,320
Nitrile	12	2,340

Speed capability depends on application conditions.

TEMPERATURE

All Turcon® Varilip® PDR seals are capable of outstanding high and low temperature performance compared to elastomeric materials.

Unlike other PTFE lip seals, the Turcon® Varilip® PDR seal is not limited in its temperature performance by the presence of an elastomer gasket. This gives it excellent temperature range capabilities.

The temperatures in Figure 107 are general working limits of the seal material and in all cases the effective limit for a rotary shaft seal application would be much lower.

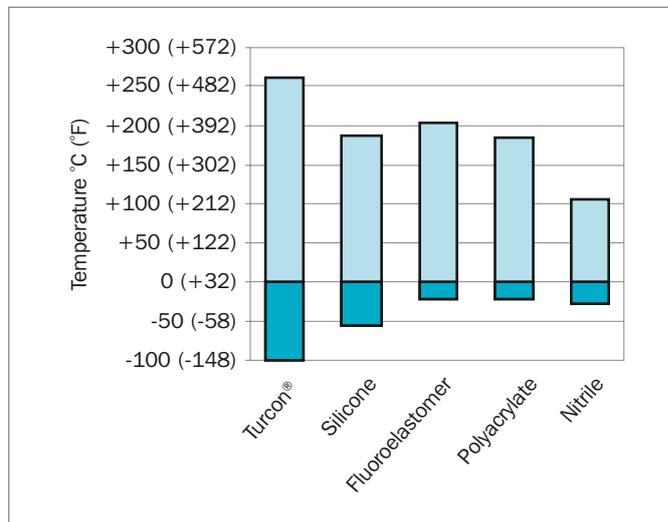

Figure 107: Maximum and minimum temperatures for different materials

Table 67: General Recommended Temperature Range

Material	Temperature			
	°C		°F	
	Min	Max	Min	Max
Filled PTFE	-100	260	-148	500
Silicone	-54	177	-65	350
Fluoroelastomer	-40	204	-40	400
Polyacrylate	-40	175	-40	347
Nitrile	-46	107	-50	225

(ref. ARPM: OS-4, Fifth Edition: 2017)

PRESSURE

The double sealing element configuration of the Turcon® Varilip® PDR Type C/Type 4 enables it to effectively seal against pressures of up to 1 MPa (145 psi). All the other standard range designs are capable of handling up to 0.5 MPa (73 psi).

Pressure heavily influences the contact force between the Turcon® sealing element and the shaft, and consequently the heat generation. This must be taken into consideration when selecting the appropriate seal type.

Turcon® Varilip® PDR seals can remain leak tight when exposed to pressurization during static shaft conditions.

FLUID RESISTANCE

Turcon® Varilip® PDR seals are resistant to mineral acids, bases, common organic fluids and solvents. They are also unaffected by oxidation, ultraviolet radiation or ozone making them ideally suited for use in the chemical industry and applications requiring exposure to the atmosphere.

A particular benefit of Turcon® Varilip® PDR seals is a resistance to oil additives and biofuels, which have an adverse effect on many elastomers. Using Turcon® Varilip® PDR allows the increased use of additives and hence a longer oil service life.

Many Turcon® materials have been successfully tested in 20% fluorine gas at temperatures in excess of 250 °C (482 °F).

LUBRICATION STARVATION

Turcon® Varilip® PDR shaft seals have the capability to run without lubrication for longer periods of time compared with elastomer radial shaft seals without adversely affecting their ultimate lifespan. This not only allows them to be used in applications where the lubrication may be intermittent as a result of start-up or other operating factors, but also allows their use as effective dirt, dust and powder seals.

NOTE

Higher speeds and pressure capabilities can be achieved through the use of custom designs. Please consult your local Trelleborg Sealing Solutions marketing company.

POWER CONSUMPTION

One of the key features of Turcon® Varilip® PDR is its low friction, resulting in very low power consumption. Figure 108 shows the running torque for a 40 mm (1.73 inch) shaft diameter Turcon® Varilip® PDR seal.

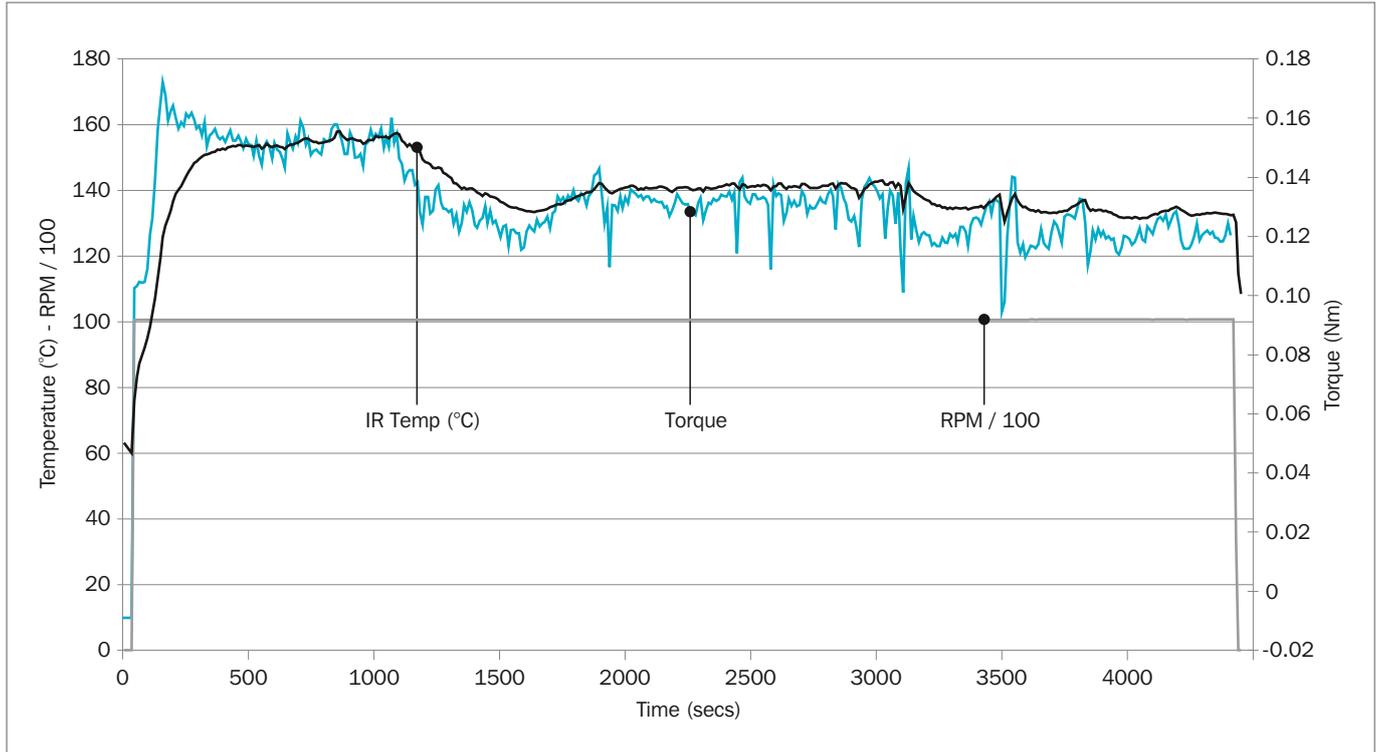

Figure 108: Running torque for Turcon® Varilip® PDR seals

Reduced torque can be achieved through custom designs but may reduce leak tightness.

NOTE

Results may vary according to application and conditions.

ENDURANCE

Turcon® Varilip® PDR rotary shaft seals can provide extended service life compared with elastomer shaft seals. As with any seal however, the life of a Turcon® Varilip® PDR seal is dependent upon the specific operating parameters.

PTFE is an inherently stable material and does not suffer from aging or degradation as with elastomers.

SEALING PERFORMANCE

The hydrodynamic feature available on Turcon® Varilip® PDR helps to ensure improved leak tightness compared to other PTFE lip seals. Note that seals with hydrodynamic features must be used only in one direction.

Sealing performance may not be optimized until the “running-in” phase, described on page 210, has been completed.

ECCENTRICITY

The graph in Figure 109 shows the maximum recommended operating envelope for Silicone, Nitrile, Polyacrylate and Fluoroelastomer seals. Turcon® Varilip® PDR seals have a specific lip design to minimize the risk of leakage and reduce wear rates. Therefore, the levels of eccentricity should be kept within the limits shown. In order to achieve a uniform radial load of the sealing lip on the shaft, the best possible coaxiality, or static offset, should be maintained between the housing bore and the shaft, maximum values shown in Figure 110.

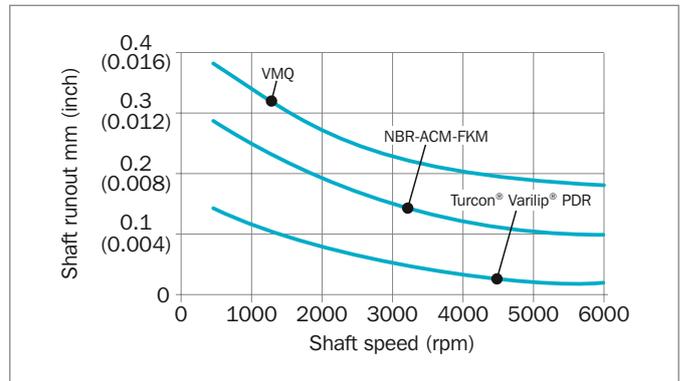

Figure 109: Dynamic eccentricity capability

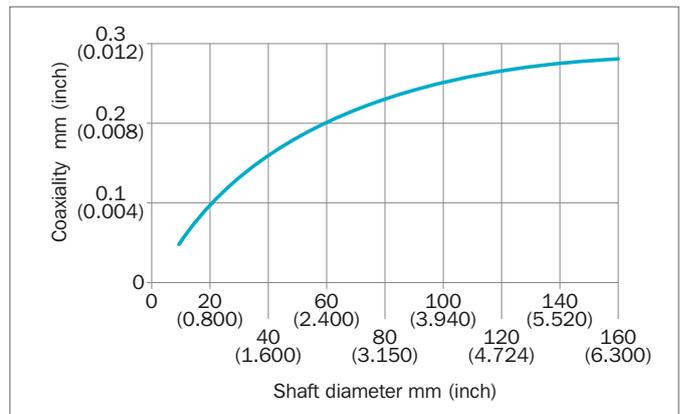

Figure 110: Coaxial tolerance capability

NOTE

The recommended maximum values for coaxiality and eccentricity will vary depending on the specific application conditions. Excessive misalignment in high speed applications results in degradation of the PTFE matrix and leads to a reduction in seal life.

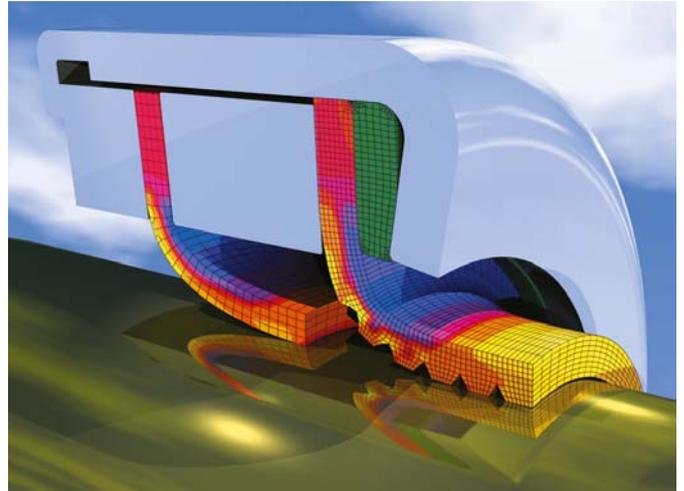

HEAT GENERATION CONSIDERATIONS

All Turcon® Varilip® PDR seals are designed to have a running contact on the shaft surface during operation. The contact force between the sealing lip and the shaft will depend upon the seal design used and the application details, but in all cases a temperature increase due to the presence of the seal can be expected. Where this increase is likely to be significant, consideration should be given to methods of reducing the level of generated heat. This can be achieved through increases in localized cooling, improved lubrication, and efficient heat transfer and dissipation mechanisms.

SHAFT WEAR

Turcon® Varilip® PDR seals are designed to contact the shaft surface during operation and a seal contact band will be evident in the majority of applications. With correct seal specification and operating conditions, shaft wear should be limited to a light polishing, but factors such as overpressure, contamination, eccentricity or insufficient shaft hardness can result in more significant wear.

As part of the system design, consideration should be given to the level of shaft wear permissible within a set operating period and therefore the benefits of measures intended to reduce the rate of wear, such as shaft surface coatings, can be analyzed in relation to their additional cost.

■ Design Guidelines

HOUSING

Turcon® Varilip® PDR seals are designed to meet global standards, including: ISO 6194/1 and ISO 16589. (See page 214 to page 218).

Turcon® Varilip® PDR seals require an interference fit with the housing bore to provide both adequate sealing of this interface and to ensure that the seal remains in place when subjected to pressure, axial movement and induced torsion produced by the relative rotary motion of shaft to housing bore. The bore should be machined with a H8 diametric tolerance as reproduced in Table 68 below. System design should also ensure that Turcon® Varilip® PDR seals are not pushed into bores that may have been previously scored by the assembly of another component, such as a bearing, selecting a larger seal outer diameter if necessary.

For Turcon® Varilip® PDR seals the bore should have a surface finish of 0.8 µm (32 µin) Ra maximum. In cases where the housing bore is split, resulting in an axial join crossing the seal outer diameter, and in cases where meeting these surface finish requirements is not possible, it is recommended that a proprietary sealant or adhesive is used.

Alternatively, a custom solution can be prepared employing a rubber covering or O-Ring for O/D sealing.

Table 68: Housing Installation Data Table

Bore Diameter				Tolerance (H8)	
Over		To		(mm)	(inch)
(mm)	(inch)	(mm)	(inch)		
10	0.394	18	0.787	+0.027 / -0	0.0011 / -0
18	0.787	30	1.181	+0.033 / -0	0.0013 / -0
30	1.181	50	1.969	+0.039 / -0	0.0015 / -0
50	1.969	80	3.150	+0.046 / -0	0.0018 / -0
80	3.150	120	4.724	+0.054 / -0	0.0021 / -0
120	4.724	180	7.087	+0.063 / -0	0.0025 / -0

250	9.843	315	12.402	+0.081 / -0	0.0032 / -0
315	12.402	400	15.748	+0.089 / -0	0.0035 / -0

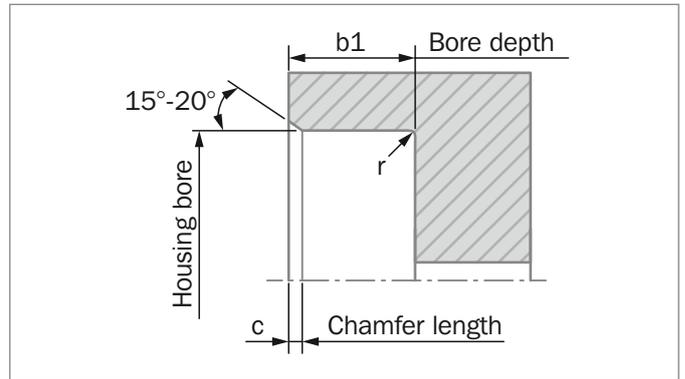

Figure 111: Housing design schematic

Table 69: Housing Design Data

Seal Width	Up to 10 mm (0.394 inch)	Over 10 mm (0.394 inch)
Min. bore depth (b1)	b + 0.5 (0.0197 in)	b + 1.0 (0.0394 in)
Chamfer length (c)	0.70 to 1.00 (0.028 in to 0.04 in)	1.20 to 1.50 (0.047 in to 0.06 in)
Max. corner rad. (r)	0.40 (0.0157 in)	0.40 (0.0157 in)

SHAFT

Shafts should be machined to an h11 tolerance or better (Table 70). The surface finish should be prepared by plunge grinding to avoid any machining leads that may act with the shaft rotation to facilitate leakage.

Table 70: Shaft Installation Data

Shaft Diameter				Tolerance (h11)	
Over		To		(mm)	(inch)
(mm)	(inch)	(mm)	(inch)		
6	0.236	10	0.394	+0 / -0.090	+0 / -0.0035

80	3.15	120	4.724	+0 / -0.220	+0 / -0.0087
120	4.724	180	7.087	+0 / -0.250	+0 / -0.0098
180	7.087	250	9.843	+0 / -0.290	+0 / -0.0114
250	9.843	315	12.402	+0 / -0.320	+0 / -0.0126
315	12.402	400	15.748	+0 / -0.360	+0 / -0.0142

Surface finish quality relates directly to dynamic seal performance. Properly defining, measuring and controlling surface finish quality is critical to the functional reliability and service life of a seal.

Developments in surface finish measurement equipment and capabilities, along with finishing methods, have resulted in functional seal testing being performed to determine and verify surface finish recommendations for improved seal performance

STANDARD SURFACE RECOMMENDATIONS

The recommended surface finishes for Turcon® Varilip® PDR are given below (Table 71 and Table 72). The first is for HVOF (High Velocity Oxygen Fuel) applied coatings like Tungsten Carbide Cobalt-Chrome ($W_C-C_O-C_r$). The second is for bare steel or chrome plating.

Table 71: Surface Finish Recommendations for HVOF Applied Surfaces

Measurement	Standard Recommendation
Ra	< 5 µin / 0.12 µm
Rp	d 8 µin max. / 0.2 µm maximum
Rz (Rtm)	40 µin / 1.0 µm maximum
Tp (Mr)	70 - 90% @ depth of p = 0.25 Rz (Rtm) relative to a ref. line c = 5% tp
Rsk	-0.1 to -3

Table 72: Surface Finish Recommendations for Chrome Plating, Bare Metal (Hardened) and Others (Non-HVOF)

Measurement	Standard Recommendation
Ra	8 - 16 µin / 0.2 - 0.4 µm
Rp	d 24 µin / 0.6 µm maximum
Rz	40 µin / 1.0 µm maximum
Tp	50 - 75% @ depth of p = 0.25 Rz (Rtm) relative to a ref. line c = 5% tp
Rsk	-0.5 to -1.5

A shaft hardness in excess of 55 HRC is generally recommended for Turcon® Varilip® PDR, although lower values are permissible depending upon the pressure, speed and sealing lip material used (refer to materials section).

PLATINGS AND COATINGS

Seals run well against unplated surfaces at moderate speeds and pressures. In high-speed rotary or high-pressure applications, harder surfaces are preferable.

Titanium shafts should be avoided unless nitrided. Shafts with hard chrome or nickel plating, finished according to the recommendations given in Table 72 are acceptable. Certain ceramic coatings can also be used, although some

grades have been proven to result in an aggressive wear of the sealing lip due to their percentage of porosity. Nitride hardening or carburising of surfaces (finished according to the recommendations given on Table 72) are also acceptable. It is important to consider the ability of the substrate to support the plating. For example, when a high-pressure load is exerted on a seal running against hard chrome plating supported by a soft substrate, such as 300 series Stainless Steel, the plating may peel or crack and then abrade the seal. A better substrate would be Stainless Steel Type 440C (hardened to 44 Rockwell C) or an alloy steel such as 4340 in the fully-hardened condition. In certain applications, it may not be possible to provide a shaft with the necessary hardness, surface finish and corrosion resistance. Fitting a wear sleeve onto the shaft can solve this problem by providing the local hardness and surface requirements without affecting the main shaft. If wear should occur, only the sleeve need then be replaced. The surface finish of the sleeve should be as outlined in Table 71 and Table 72. Consideration should be given to providing adequate heat dissipation and effective sealing to the interface between the wear sleeve and the shaft.

RUNNING IN

In standard rotary shaft systems, the seals and mating surfaces have an initial period of higher wear. This phase, known as the run-in, ends once the peaks on the mating surface are broken off and both surface and seal reach an equilibrium state. Provided the seals are sufficiently lubricated, the wear rate drops significantly once the equilibrium state is reached. By defining the surface finish using multiple surface finish parameters, the overall surface profile can be controlled more precisely. This reduces the sealing system run-in period, and once equilibrium between the seal and sealing surface is reached, gives an improved surface finish for leakage control, wear resistance and service life. The abrasive nature of a rough finish can cause excessive seal wear during the early run-in period. Therefore, the harder the mating surface, the more important it is to start with the correct surface finish.

■ Installation Requirements

When installing Turcon® Varilip® PDR seals, careful handling is important in order to avoid damaging the sealing lip. If the seal is installed directly on to the shaft, lead-in chamfers must be machined on the end of the shaft with no burrs, sharp corners or rough machining marks. The leading diameter should be smaller than the unstressed diameter of the sealing lip, as shown in Figure 112. Table 73 shows guide values for this.

It is recommended that as shallow an angle as practical be adopted within the range given.

Table 73: Shaft Lead-in Chamfer
(Ref. Figures 111 and 112)

d1		d1 - d3	
(mm)	(inch)	(mm)	(inch)
< 10	0.4	1.5	0.06
10 - 20	0.4 - 0.8	2.0	0.08
20 - 30	0.8 - 1.2	2.5	0.10
30 - 40	1.2 - 1.6	3.0	0.12
40 - 50	1.6 - 2.0	3.5	0.14
50 - 70	2.0 - 2.8	4.0	0.16
70 - 95	2.8 - 3.7	4.5	0.18
95 - 130	3.7 - 5.1	5.5	0.22
130 - 240	5.1 - 9.4	7.0	0.28
240 - 300	9.4 - 11.8	11.0	0.43

It is preferable to use an installation cone, as shown in Figure 113, where the seal can be fitted onto the cone before being located on the shaft to ensure correct orientation of the sealing lip.

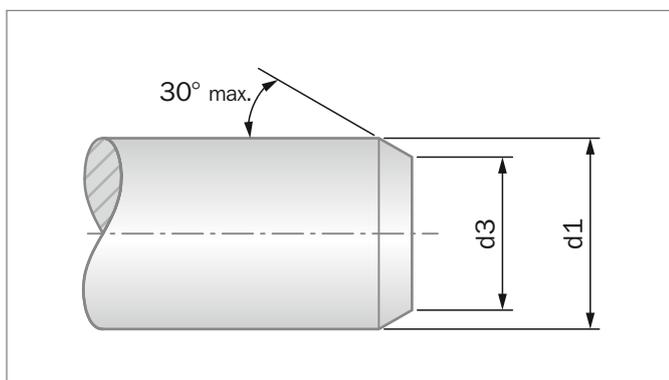

Figure 112: Shaft lead-in chamfer

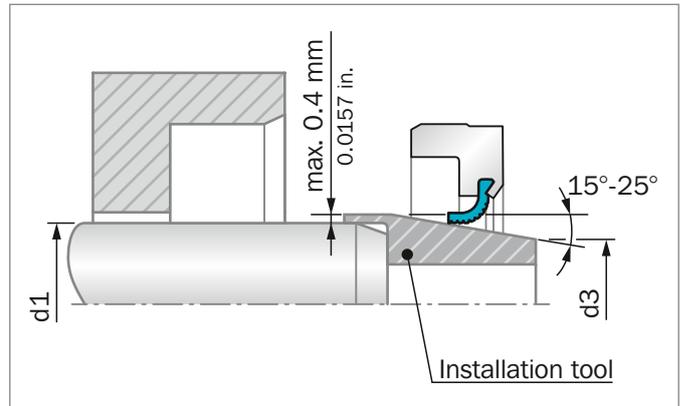

Figure 113: Fitting the sealing lip using an installation tool

Fitting should be performed in a swift movement to limit the time that the lip is formed above shaft size therefore reducing lip recovery time.

■ Storage

Turcon® Varilip® PDR seals do not require any special storage conditions, which unlike elastomer seals must be kept away from sunlight and elevated temperatures to avoid rubber degradation.

Turcon® Varilip® PDR seals are not subject to shelf life.

■ Fitting Instructions

Investigation of premature failures has shown that a significant proportion results of inappropriate installation techniques. However, by observing the following guidelines, such failures can be avoided:

- Assembly sleeves and fitting tools should be regularly checked for signs of damage.
- When supplied on mandrels, the seals should not be removed from the mandrel until immediately prior to fitting. Seals supplied on cardboard mandrels should be removed in the direction such that the spiral paper overlay of the mandrel is not lifted.
- Turcon® Varilip® PDR seals should be assembled on to the shaft in an unlubricated (dry) condition to avoid contamination of the hydrodynamic feature (if present).
- Care should be taken not to damage the outer diameter surface of the seal.
- Seals should be pressed squarely into the housing with the pressing-in force applied as close as possible to the outside diameter of the seal.
- If the seal contains a hydrodynamic feature on the sealing lip, ensure that it is correctly oriented in relation to the shaft's direction of rotation.
- Normal practice is to install the seal with the lip facing the media to be sealed (the seal is reversed only when it becomes more important to exclude a media than to retain it).
- Proprietary sealants or adhesives may be used for improved sealing of the outer diameter in critical applications or for seal retention purposes.
- Be aware that the extended metal pressure support behind the lip arrangement of the Type C design has a close clearance to the shaft (Figure 116). It is advised that the inside diameter of this support is measured before manufacturing the assembly cone to ensure that there is sufficient clearance.

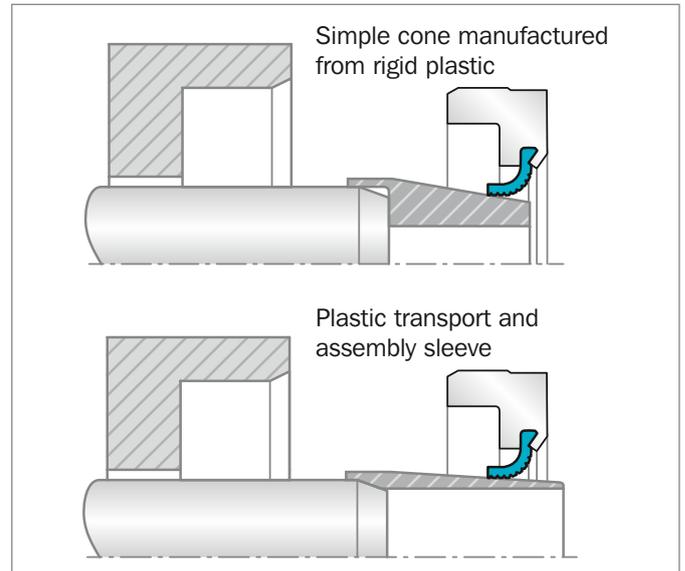

Figure 114: Assembly tooling types for installation on shafts

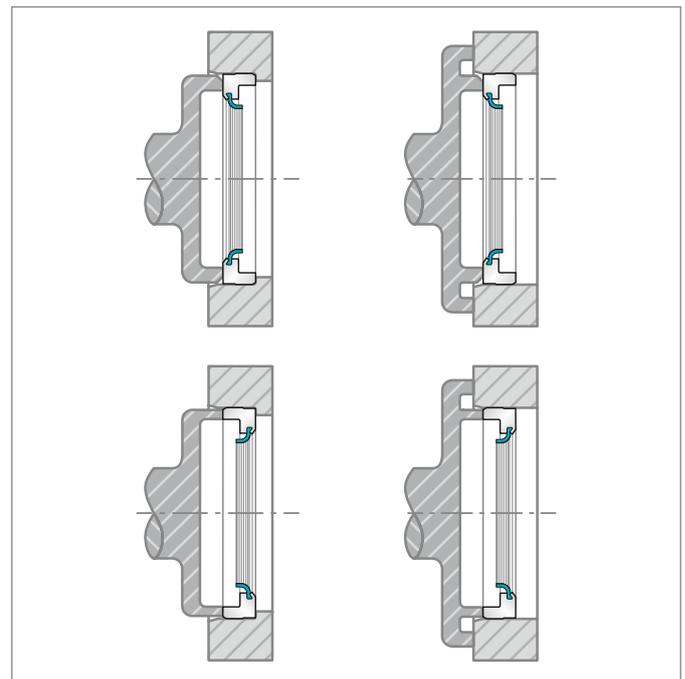

Figure 115: Assembly tooling types for press fit into a housing

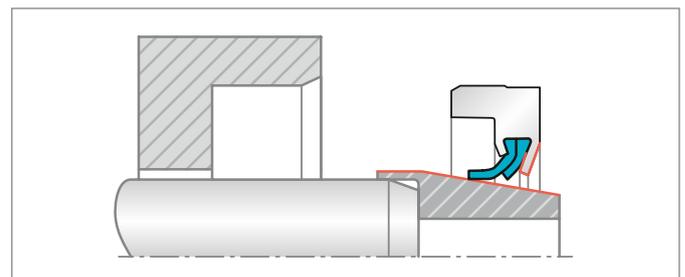

Figure 116: Ensure there is sufficient clearance between the support leg and the assembly cone

■ Installation Recommendations

The following diagrams show installation recommendations in respect to seal retention under pressurized conditions.

POST INSTALLATION RECOMMENDATIONS

If painting the housing after installation, be sure to mask the seal. Avoid getting any paint on the lip, or the shaft where the lip rides. Also, mask any vents or drain holes so they will not become clogged. Be sure to remove masks before operating unit.

If paint is to be baked, or the mechanism is otherwise subjected to heat, seals should not be heated to temperatures higher than their materials can tolerate. Contact your local Trelleborg Sealing Solutions marketing company for guidance.

When cleaning or testing, do not subject seals to any fluids or pressures other than those for which the seals have been specified.

Extraction features such as tapped holes, internal threads or simple grooves can be included in custom Turcon® Varilip® PDR designs.

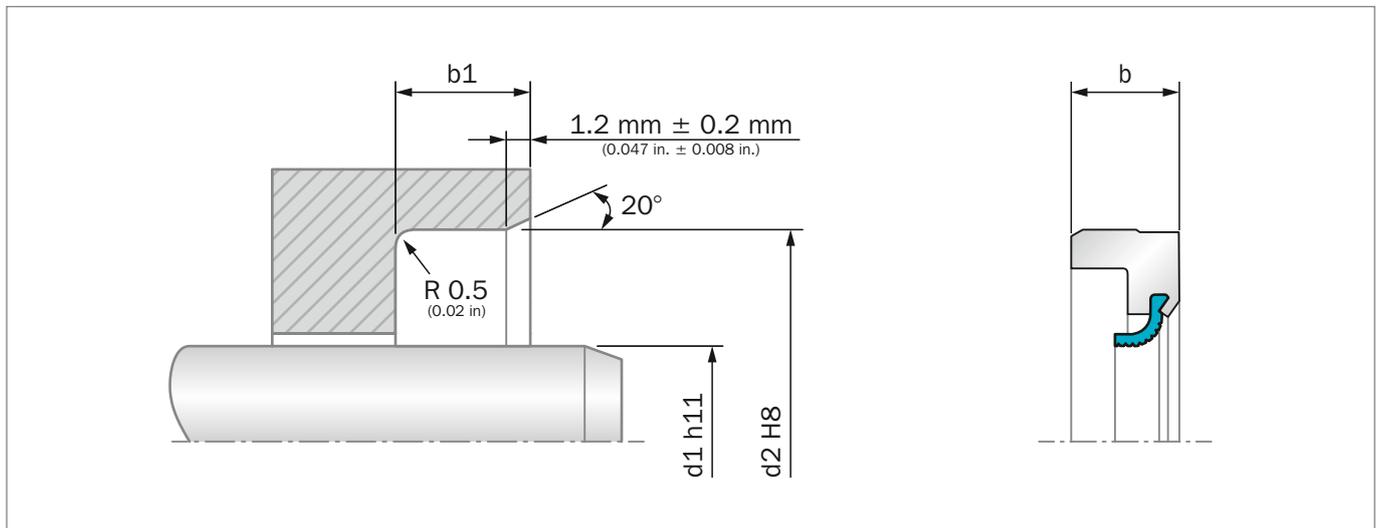

Figure 117: Installation drawing for pressures up to 0.5 MPa (73 psi)

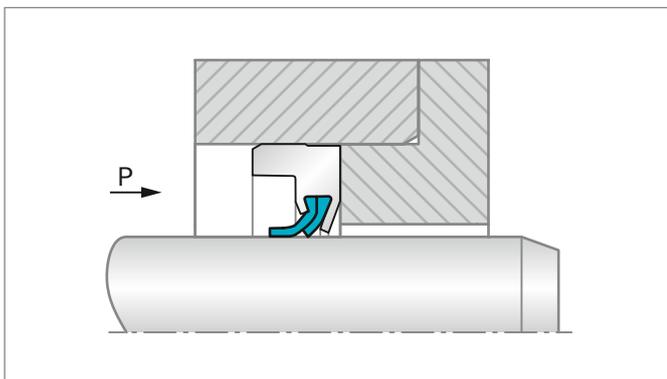

Figure 118: Installation for pressure from 0.5 MPa (73 psi) up to 1 MPa (145 psi). It is recommended to machine the housing to support the back of the seal.

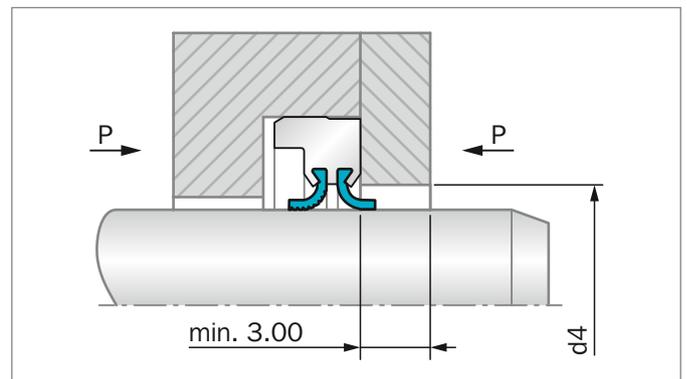

Figure 119: Installation type for fluid separation (Type D) at pressures up to 0.5 MPa (73 psi).

Turcon® Varilip® PDR Size Ranges

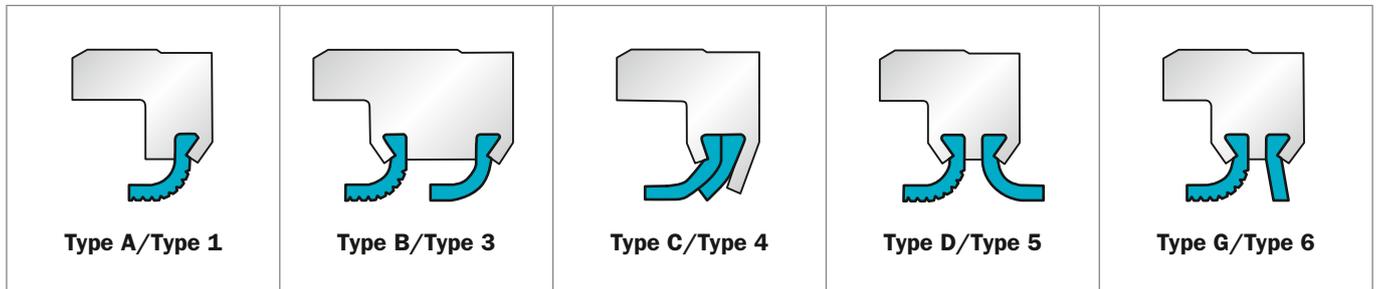

Table 74: Turcon® Varilip® PDR Metric Size Range

■ HiSpin® PDR RT

GENERAL DESCRIPTION

HiSpin® PDR RT is a high performance, bi-directional rotary seal designed to withstand high speeds, particularly in e-Mobility applications. With a machined metal body and high performance Turcon® sealing element, it offers seal integrity whether in dry, moist or lubricated environments. Extensive testing under extreme operating conditions has proven its sealing efficiency at high rotational speeds.

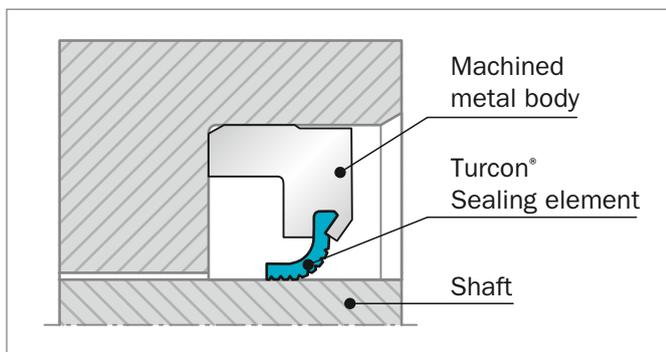

Figure 120: HiSpin® PDR RT

METHOD OF OPERATION

Developers are continuously improving the effectiveness of the electric drive unit; a combined electric motor and gearbox in a shared housing.

The drive unit is the main cost-driver of future electric vehicle development and offers new challenges for automotive manufacturers. While the gearbox requires efficient lubrication, it is essential that the motor remains dry. Therefore, a highly reliable seal is required between the two parts.

Running in dry, moist or lubricated environments, HiSpin® PDR RT meets ever growing demand for seal integrity at increasingly higher rotational speeds. The seal has excellent sealing characteristics at speeds of up to at least 60 meters per second.

A combination of a unique material, an innovative manufacturing process and specialized sealing lip design, reduces the friction by up to 75 percent when compared to traditional PTFE seals, leading to a significant reduction in power consumption. In addition, heat generation is reduced, as is wear for both the seal itself and its mating surface.

ADVANTAGES

- High speed operation (up to 60 m/s and beyond)
- Bi-directional sealing capability
- Compact design to reduce assembly space
- Wide temperature range, from -60 °C to +200 °C
- Capable of operation in low/medium pressure environments
- Excellent sealing performance with and without lubrication
- Extremely low friction and heat development
- Wide media compatibility
- Negligible shaft wear
- Design optimized for durability and long service life
- Provided in accordance with IATF 16949

APPLICATION EXAMPLES

- HiSpin® PDR RT provides optimal sealing in:
- Electric drive units for e-Mobility applications
 - High speed electric drive units

OPERATING CONDITIONS

Seal performance is influenced by such factors as lubrication capability of the sealed media and heat dissipation in the hardware, it follows that testing should always be performed. With good lubrication, the following values can be assumed as a guideline:

Pressure:	dependent upon design and application
Temperature:	-60 °C to +200 °C
Speed:	Up to 60 m/s and beyond
PV:	dependent upon design and application
Acceleration:	dependent upon design and application
Media:	Wide range of commonly used rotary fluids

MATING SURFACE MATERIALS

Sealing of applications with rotating movements requires very good mating surfaces. A minimum hardness of 55 HRC to a hardening depth of at least 0.5 mm is recommended - at higher speed and/or pressures, 60 to 64 HRC and a depth of 0.5 to 1.0 mm is recommended.

Ra:	0.1 - 0.2 µm
Rz:	1.0 µm
Bearing ratio (Tp (Mr)):	(50 - 70% @ depth of p = 0.25 Rz (Rtm); relative to a ref. line c: 5% tp)
Mating surface hardness:	min. 55 HRC

IMPORTANT NOTE

Housing design and correct installation are important for the performance of the HiSpin® PDR RT. Information on shaft and housing design with installation guides are available from your local Trelleborg Sealing Solutions marketing company.

AGING AND TORQUE

To prove the performance and longevity of HiSpin® PDR RT, testing using real-world speeds and media likely to be encountered during operation has been undertaken. Test conditions are given in Table 78 and the running profile is shown in Figure 121.

Table 78: Test Conditions for HiSpin® PDR RT

Shaft diameter:	Ø 38 mm
Shaft speed:	21,000 rpm
Temperatures:	up to +150°C
Media:	ATF Fluid
Test cycle:	Load cycle according to figure and according to ISO 6149
Test duration:	500 hours

Figure 121: Example running profile showing varying rotational speeds throughout testing

Testing in material development laboratories have repeatedly shown the effectiveness of Turcon® as a sealing material. Experiments show the wide temperature range of Turcon® extends above and below the values for standard elastomer materials (Figure 122). Similarly, when compared with standard Radial Oil Seals, HiSpin® HS40 generates significantly less torque, even at high rotational speeds (Figure 123).

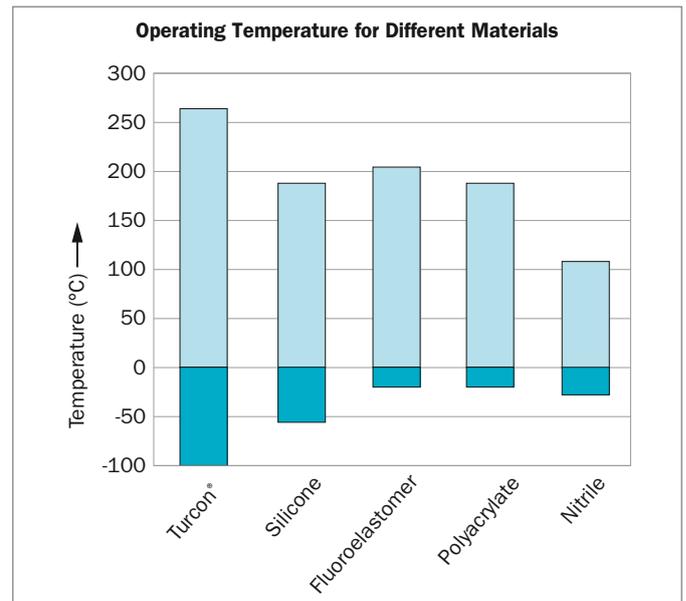

Figure 122: Operating temperatures for Turcon® materials compared with other elastomers

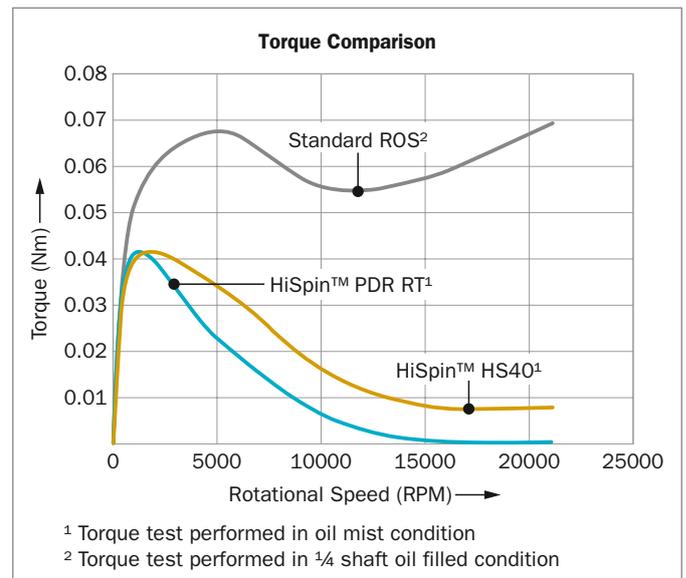

Figure 123: Torque comparison for HiSpin® products versus standard Radial Oil Seals

ORDERING INFORMATION

Turcon[®] and Zurcon[®] Roto Seals

! This page is intentionally left blank.

Turcon[®] Roto Glyd Ring[®]

■ Turcon® Roto Glyd Ring®

■ General Description

Double-acting Turcon® Roto Glyd Ring® is used to seal shafts, axles, cylinder bores, rotary manifolds, and swivels with rotary, helical or oscillating movement. It consists of a seal ring in high-grade Turcon® material activated by an elastomeric O-Ring.

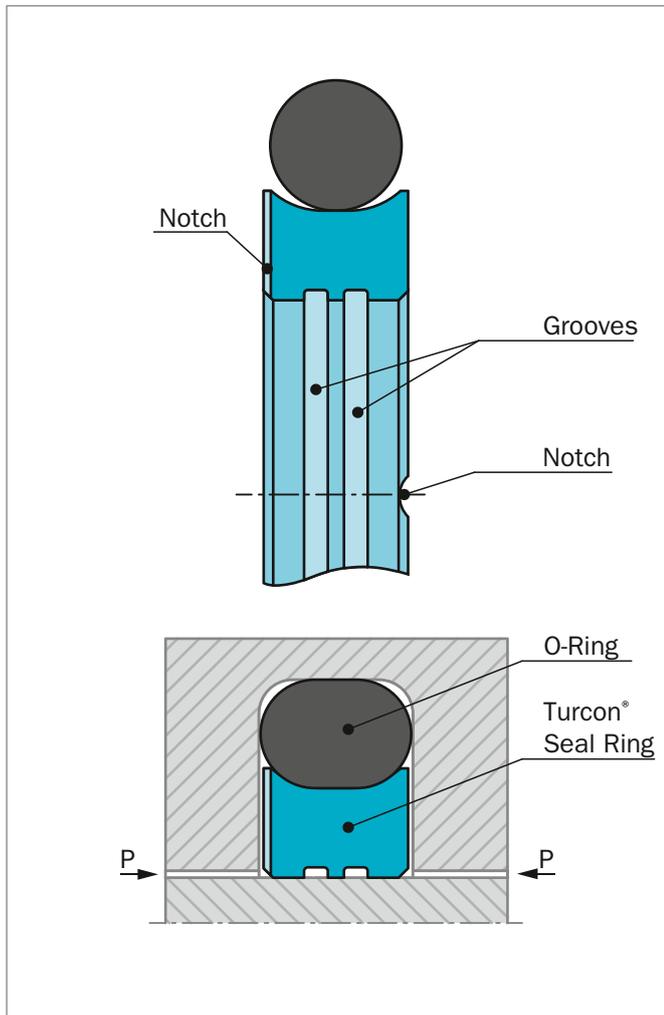

Figure 124: Turcon® Roto Glyd Ring®

The contact surface profile of the seal ring is specially designed for use at high-pressure and low sliding speeds.

METHOD OF OPERATION

The double-acting performance of the seal follows from the symmetrical cross section which allows the seal to respond to pressure in both directions.

Initial contact pressure is provided by radial compression of the O-Ring. When the system pressure is increased the O-Ring transforms this into additional contact pressure, the contact pressure of the seal is thereby automatically adjusted so sealing is ensured under all service conditions.

Depending on the profile cross-section of the seal, the contact surface has none, one or two continuous machined grooves. These improve seal efficiency by increasing the specific surface load pressure against the sealed surface. They also form a lubricant reservoir and reduce friction.

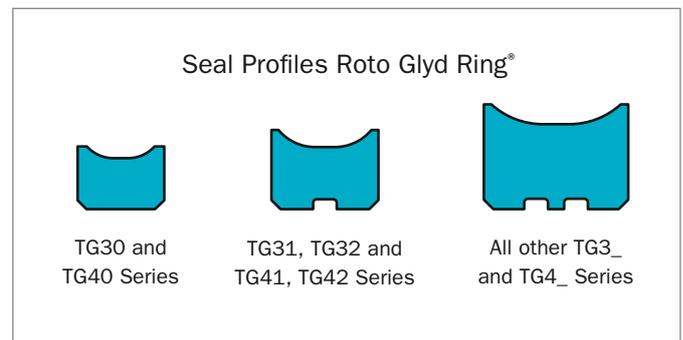

Figure 125: Crosssection profiles depending on Series No.

NOTCH

To assure rapid activation of the seal at sudden changes of pressure and direction of motion, radial notches are added on both sides of the seal ring.

ADVANTAGES

- Initial contact pressure of Roto Glyd Ring® is available for shaft and bore sealing applications
- Double-acting seal
- Low friction
- Lubricant reservoir
- Stick-slip free operation
- No vulcanizing to mating surfaces
- Simple groove design
- Small groove dimensions
- For use at high-pressure and low sliding-speeds
- Available in all sizes up to 2,700 mm diameter (to 2,600 mm for shaft seals)

TYPICAL APPLICATIONS

Roto Glyd Ring® is used as a double acting rotary seal for hydraulic and pneumatic equipment in sectors such as:

- Rotary distributors and unions
- High pressure valve stems
- Manipulators
- Pivoting motors in mobile hydraulics and machine tools
- Hydraulic motors
- Blow molding machines
- Top drives
- Rotary tables
- FPSO swivel units
- Core cutting equipment

OPERATING CONDITIONS

Seal performance is influenced by such factors as lubrication capability of the sealed medium and heat dissipation in the hardware. It follows that testing should always be made. With good lubrication, the following values can be used:

Pressure:	Up to 30 MPa
Speed:	Up to 2.0 m/s
PV:	Up to 2.5 MPa m/s The value must be reduced for diameters < 50 mm.
Temperature:	-45 °C to +200 °C*) depending on O-Ring elastomer and medium
Media:	Mineral oil-based hydraulic fluids, flame retardant hydraulic fluids, environmentally-friendly hydraulic fluids (bio-oils), water and others depending on seal and elastomer material.

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure and temperature and gap value. Temperature range also dependant on media.

*) IMPORTANT NOTE FOR THE BORE VERSION

In the case on unpressurized applications in temperatures below 0 °C please contact your local Trelleborg Sealing Solutions marketing company for more information.

FRICITIONAL POWER

Guide values for the frictional power P can be determined from the graph in Figure 126. They are shown as a function of the sliding speed and operating pressure for a shaft diameter of 50 mm / 1.968 inch with an oil temperature of +60 °C. At higher temperatures, these application limits must be reduced.

Formula for other diameters d:

$$P = \frac{P_{50} \times (d)}{(50 \text{ mm})} \text{ [W]}$$

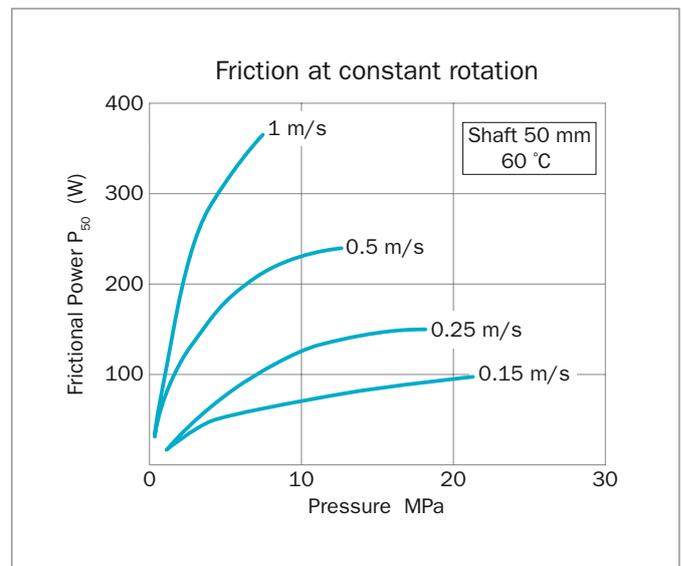

Figure 126: Frictional power for Turcon® Roto Glyd Ring®

The guide values apply for constant operating conditions. Changes in operating conditions such as pressure fluctuations or alternating directions of shaft rotation can result in considerably higher friction values.

INSTALLATION INSTRUCTIONS

Roto Glyd Ring® is installed according to information starting at page 313.

Closed groove installation according to dimensions at Table 80, page 236.

RECOMMENDED MATERIALS

The following material combinations have proven effective for rotary applications:

Turcon® Roto Glyd Ring® in Turcon® T40

All-round material in lubricating fluids and fluids with limited lubrication e.g. water:

O-Ring: NBR 70 Shore A N
 FKM 70 Shore A V
 HNBR 70 Shore A H
 (according to temperature)

Set code: T40N, T40V or T40H

Turcon® Roto Glyd Ring® in Turcon® M15

Material for light to medium applications with high sealing effect in fluids with good lubrication:

O-Ring: NBR 70 Shore A N
 FKM 70 Shore A V
 HNBR 70 Shore A H
 (according to temperature)

Set code: M15N, M15V or M15H

Turcon® Roto Glyd Ring® in Zurcon® Z80

For slow turning applications with fluids, air, gases and risk of high abrasive wear; temperature limit -45 °C to +80 °C:

O-Ring NBR 70 Shore A

Set code: Z80N

Z80 are for slow turning motion and not for constant rotation.

For specific applications other Turcon® and Zurcon® materials are available.

Table 79: Turcon® Roto Glyd Ring®

Material, Applications, Properties	Code	O-Ring Material Shore D	Code	Service Temp. * °C	Mating Surface Material	MPa max. Dynamic
Turcon® M04 For lubricating and non-lubricating fluids and gases Smooth and tight surface texture Good sealing performance Suitable for softer mating surfaces High extrusion resistance For swiveling and low velocity rotary service only Carbon filled Color: Black	M04	NBR 70	N	-30 to +100	Steel	30
		NBR 70 Low temp.	T	-45 to +80	Hardend steel	
		FKM 70	V	-10 to +200		
		HNBR 70	H	-30 to +150		
Turcon® M15 Recommended material for rotary motion For lubricating fluids Tight surface texture Good sealing performance Very good wear properties Low friction Good extrusion resistance Suited to softer mating surfaces Polyaramide, mineral fiber, lubricant, graphite and Turcon® filled Color: Dark gray	M15	NBR 70	N	-30 to +100	Hardend steel	30
		NBR 70 Low temp.	T	-45 to +80		
		FKM 70	V	-10 to +200		
		HNBR 70	H	-30 to +150		
Turcon® M30 For lubricating and non-lubricating fluids and gases Good wear and extrusion resistance Suited to high temperature service Tight surface structure Good sealing performance Suited to softer surfaces For swiveling and low velocity rotary service only Aromatic polymer, graphite, Turcon® filled Color: Dark green-gray	M30	NBR 70	N	-30 to +100	Steel	30
		NBR 70 Low temp.	T	-45 to +80	Hardend steel	
		FKM 70	V	-10 to +200	Stainless steel	
		HNBR 70	H	-30 to +150	Titanium HVOF Tungsten carbide	

Table is continued on next page

Material, Applications, Properties	Code	O-Ring Material Shore D	Code	Service Temp.* °C	Mating Surface Material	MPa max. Dynamic
Turcon® T10 For lubricating and non-lubricating fluids and gases Suitable for slow rotary service in lubricating fluid High extrusion resistance Not for electrically conducting fluids Carbon, graphite filled Color: Black	T10	NBR 70	N	-30 to +100	Steel Hardend steel Chrome-plated steel (rod) Stainless steel	30
		NBR 70 Low temp.	T	-45 to +80		
		FKM 70	V	-10 to +200		
		EPDM 70	E	-45 to +145		
Turcon® T40 All-round material for rotary and turning movements Good wear resistance and service life with both lubricating and non-lubricating fluids Surface texture less suited to gas sealing Carbon fiber filled Color: Gray	T40	NBR 70	N	-30 to +100	Hardend steel Hard Alloys	30
		NBR 70 Low temp.	T	-45 to +80		
		FKM 70	V	-10 to +200		
		HNBR 70	H	-30 to +150		
Zurcon® Z80 For lubricating and non-lubricating fluids and gases High abrasion and extrusion resistance Well suited to abrasive mating surfaces and fluids For swiveling and intermittent low velocity rotary service only Good chemical resistance Ultra-high molecular weight polyethylene Color: White to off-white	Z80	NBR 70	N	-30 to +80	Steel Hardend steel Ceramic coatings HVOF Tungsten carbide	30
		NBR 70 Low temp.	T	-45 to +80		

* Service temperatures are only valid when using hydraulic mineral oil. Note that frictional heat may cause increased temperatures at the seal.

Recommended material.

Note:

Rotary seals exert high loads on mating surfaces and mild steels are best suited for slow or swiveling service.

As a basic principle, the hardness of the mating surface should increase with the peripheral speed, and a hardness of 60 HRC is recommended for velocities above 1 m/s. Due to the mechanical stresses imposed, a hardness depth of 0.5 mm or more is recommended to limit dimensional changes to the mating surface.

■ Installation Recommendation for Shaft

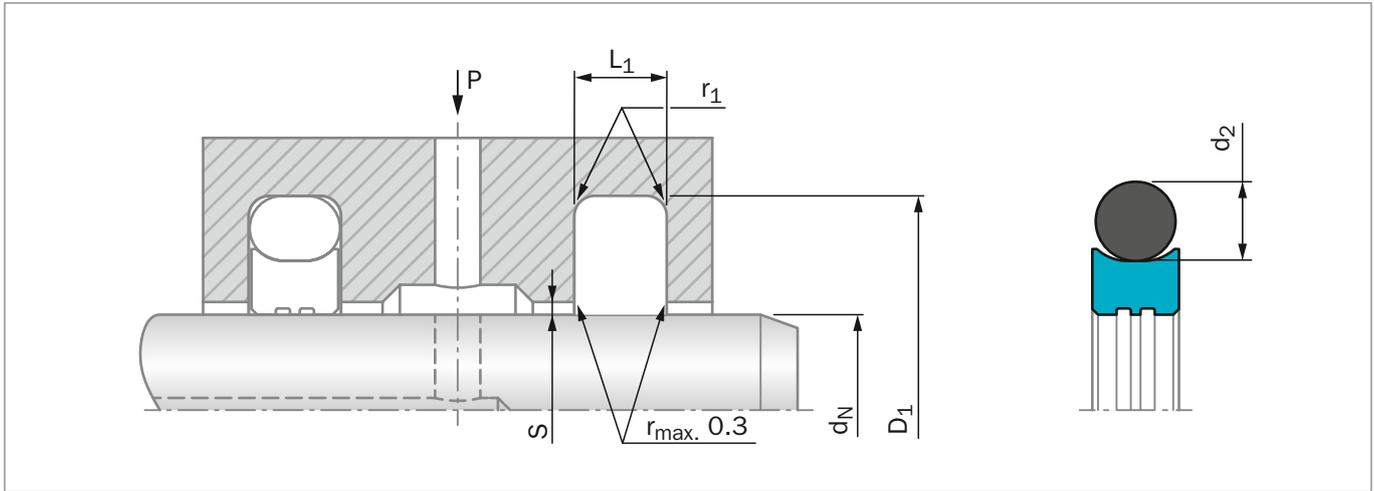

Figure 127: Installation Drawing

Table 80: Installation Dimensions – Standard Recommendations

Series Number	Shaft Diameter d_N f8/h9		Groove Diameter D_1 H9	Groove Width $L_1 +0.2$	Radius r_1	Radial Clearance S_{max}^*			O-Ring Cross-Section- \emptyset d_2	No. of Grooves in the Sealing Surface
	Recommended Range	Available Range				10 MPa	20 MPa	30 MPa		
TG30	6 - 18.9	6 - 130.0	$d_N + 4.9$	2.20	0.40	0.20	0.15	-	1.78	0
TG31	19 - 37.9	10 - 245.0	$d_N + 7.5$	3.20	0.60	0.25	0.20	0.15	2.62	1
TG32	39 - 199.9	19 - 455.0	$d_N + 11.0$	4.20	1.00	0.30	0.25	0.20	3.53	1
TG33	200 - 255.9	38 - 655.0	$d_N + 15.5$	6.30	1.30	0.35	0.30	0.25	5.33	2
TG34	256 - 649.9	120 - 655.0	$d_N + 21.0$	8.10	1.80	0.40	0.35	0.30	7.00	2
TG35	650 - 999.9	650 - 999.9	$d_N + 28.0$	9.50	2.50	0.45	0.40	0.35	8.40	2
TG35X	1,000 - 2,600	-	$d_N + 28.0$	9.50	2.50	0.45	0.40	0.35	8.40	2

* At pressures > 30 MPa: Use diameter tolerance H8/f8 (bore/shaft) in area of seal.

At pressures > 10 MPa it is recommendable to choose the next larger cross section according to the column "Available range" i.e. for shaft $\emptyset d_N = 80$ mm: TG33 00 800-.

ORDERING EXAMPLE

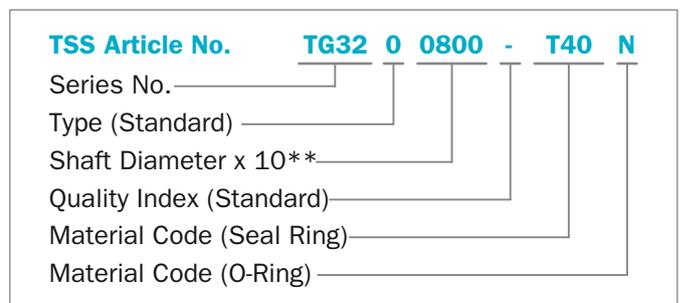

Turcon® Roto Glyd Ring®, complete with O-Ring, standard application:

Series: TG32 from Table 80

Shaft diameter: $d_N = 80.0$ mm

TSS Part No.: TG3200800 from Table 81

Select the material from Table 79. The corresponding code numbers are appended to the TSS Part No. Together they form the TSS Article No. The TSS Article No. for all intermediate sizes not shown in Table 81 can be determined following the example opposite.

** For diameters $\geq 1,000.0$ mm multiply only by factor 1.
Example: TG35X for diameter 1,200.0 mm
TSS Article No.: TG35X1200 – T40N

Table 81: Standard Installation Dimensions / TSS Part Number

TG45	670 - 999.9	-	$D_N - 28.0$	9.50	2.50	0.45	0.40	0.35	8.40	2
TG45X	1,000 - 2,700	-	$D_N - 28.0$	9.50	2.50	0.45	0.40	0.35	8.40	2

* At pressures > 30 MPa: Use diameter tolerance H8/f8 (bore / shaft) in area of seal.

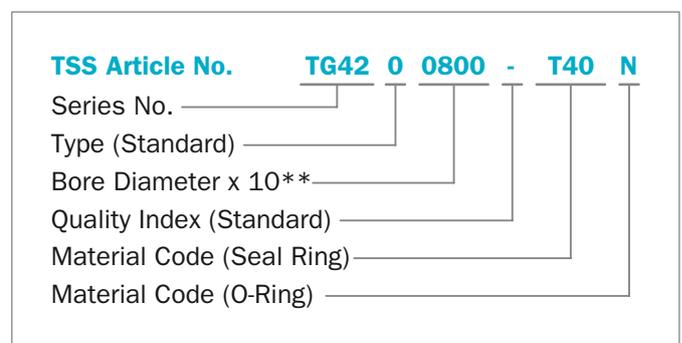

At pressures > 10 MPa it is recommendable to choose the next larger cross section according to the column "Available range" i.e. for shaft $\emptyset D_N = 80$ mm: TG43 00 800-.

ORDERING EXAMPLE

Roto Glyd Ring®, complete with O-Ring, standard application:

Series:	TG42 from Table 82
Boe diameter:	$D_N = 80.0$ mm
Dimensions:	TG4200800 from Table 83

Select the material from Table 79. The corresponding code numbers are appended to the TSS Part No. Together they form the TSS Article No. The TSS Article No. for all intermediate sizes not shown in Table 83 can be determined following the example opposite.

** For diameters $\geq 1,000.0$ mm multiply only by factor 1.

Example: TG35X for diameter 1,200.0 mm

TSS Article No.: TG45X1200 – T40N

Table 83: Standard Installation Dimensions / TSS Part Number

Turcon[®] Roto Glyd Ring[®] K

■ Turcon® Roto Glyd Ring® K

■ General Description

Turcon® Roto Glyd Ring® K is used to seal shafts, axles, bores, rotary manifolds and swivels with rotary, helical or oscillating movement. It consists of a seal ring in high-grade Turcon® material activated by an elastomer O-Ring.

The contact surface profile of the seal ring is specially designed for use at high pressure and low sliding speeds.

Preferably, the Roto Glyd Ring® K version is used as single-acting seal because of its asymmetric appearance although a semi double-acting sealing function is maintained.

Roto Glyd Ring® K is supplied with an axial pressure relief groove. As illustrated in Figure 129, the continuous radial groove is on one side linked to the pressure chamber.

The seal is thus relieved of pressure from one side and can be used for higher PV values than Turcon® Roto Glyd Ring®.

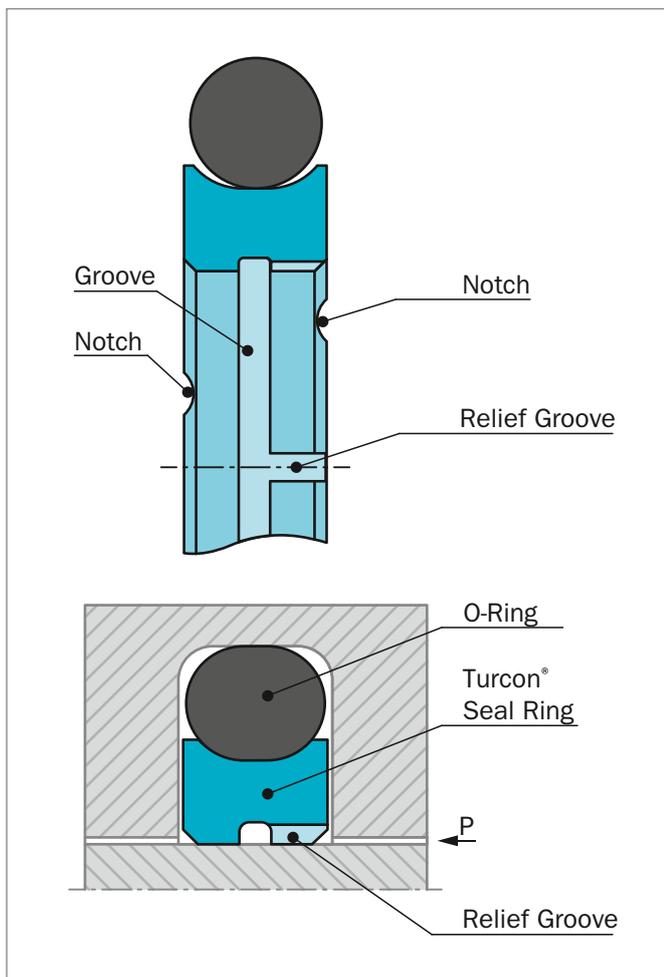

Figure 129: Turcon® Roto Glyd Ring® K with pressure relief.

This Roto Glyd Ring® version is identified in the TSS Article Number by a "K" at the 5th digit, see Ordering Examples. For this seal, the direction of installation must be observed.

METHOD OF OPERATION

Initial contact pressure of the Roto Glyd Ring® K is provided by radial compression of the O-Ring. When the system pressure is increased, the O-Ring transforms this into additional contact pressure. The contact pressure of the seal is thereby automatically adjusted so sealing is ensured under all service conditions.

The single-acting performance of the seal follows from the asymmetrical cross section which allows the seal to respond to high pressure in one direction.

The axial pressure relief groove connecting the pressurized fluid to the circumferential center groove ensures a pressure balance of more than half of the seal contact area. This significantly reduces the seal friction when compared to the double-acting Roto Glyd Ring®.

As the K version still has full sealing contact and hold pressure from both directions, it can act as a double-acting rotary seal. The relieved side must be installed on the side with the higher pressure.

The unrelieved side of the seal is only for low pressure, which should not exceed 3 MPa as it is not sufficiently supported to prevent extrusion from high pressure.

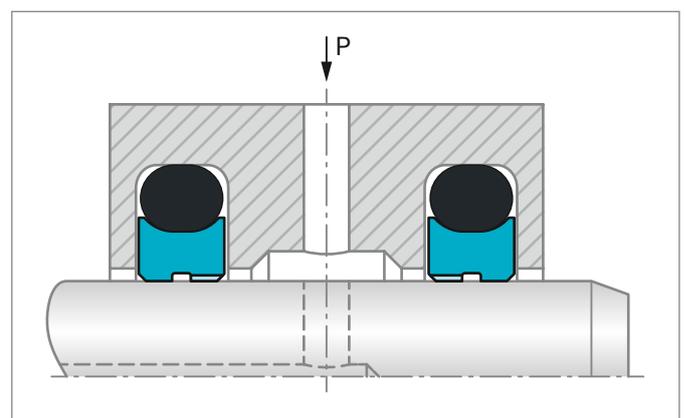

Figure 130: Right installation of Roto Glyd Ring® K

NOTCH

To assure rapid activation of the seal at sudden changes of pressure and direction of motion, radial notches are added on both sides of the seal ring.

ADVANTAGES

- Single-acting rotary seal
- Simple groove design
- Small groove dimensions
- Very low friction
- Stick-slip free operation
- No vulcanizing to mating surfaces

TYPICAL APPLICATIONS

Roto Glyd Ring® K is preferably used as a single-acting rotary seal for hydraulic and pneumatic equipment in applications such as:

- In end caps of rotary distributors and unions
- High pressure valve stems
- Manipulators
- Hydraulic motors
- Pivoting motors in mobile hydraulic and machine tools
- Blow molding machines

OPERATING CONDITIONS

Seal performance is influenced by such factors as lubrication capability of the sealed medium and heat dissipation in the hardware. It follows that testing should always be made.

With good lubrication, the following values can be assumed:

Pressure:	Up to 30 MPa (from pressure relieved side) Up to 3 MPa (from pressure unrelieved side)
Speed:	Up to 2.0 m/s
PV:	Up to 2.5 MPa m/s The value must be reduced for diameters < 50 mm.
Temperatures:	-45 °C to +200 °C *) depending on O-Ring elastomer and medium
Media:	Mineral oil-based hydraulic fluids, flame-retardant hydraulic fluids, environmentally friendly hydraulic fluids (bio-oils), water and others, depending on seal and elastomer material.

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also depends on media.

*) IMPORTANT NOTE

In the case of unpressurized applications in temperatures below 0 °C please contact your local Trelleborg Sealing Solutions marketing company for more information.

INSTALLATION INSTRUCTIONS

Roto Glyd Ring® is installed according to information at page 313.

Closed groove installation according to dimensions at Table 85 on page 248.

RECOMMENDED MATERIALS

The following material combinations have proven effective for rotary applications:

Turcon® Roto Glyd Ring® K in Turcon® T40

All-round material in lubricating fluids and fluids with limited lubrication e.g. water:

O-Ring:	NBR 70 Shore A	N
	FKM 70 Shore A	V
	HNBR 70 Shore A	H
	(according to temperature)	

Set code: T40N, T40V or T40H

Turcon® Roto Glyd Ring® K in Turcon® M15

Material with high sealing effect for light to medium applications in fluids with good lubrication:

O-Ring:	NBR 70 Shore A	N
	FKM 70 Shore A	V
	HNBR 70 Shore A	H
	(according to temperature)	

Set code: M15N, M15V or M15H

Turcon® Roto Glyd Ring® K in Zurcon® Z80

For slow turning applications with fluid, air, gases and risk of high abrasive wear; temperature limit -45 °C to +80 °C:

O-Ring	NBR 70 Shore A
--------	----------------

Set code: Z80N

Z80 are for slow turning motion and not for constant rotation.

For specific applications other Turcon® and Zurcon® materials are available.

Table 84: Turcon® Roto Glyd Ring® K

Material, Applications, Properties	Code	O-Ring Material Shore D	Code	Service Temp. * °C	Mating Surface Material	MPa max. Dynamic
Turcon® M04 For lubricating and non-lubricating fluids and gases Smooth and tight surface texture Good sealing performance Suitable for softer mating surfaces High extrusion resistance For swiveling and low velocity rotary service only Carbon filled Color: Black	M04	NBR 70	N	-30 to +100	Steel	30
		NBR 70 Low temp.	T	-45 to +80	Hardend steel	
		FKM 70	V	-10 to +200		
		HNBR 70	H	-30 to +150		
Turcon® M15 Recommended material for rotary motion For lubricating fluids Tight surface texture Good sealing performance Very good wear properties Low friction Good extrusion resistance Suited to softer mating surfaces Polyaramide, mineral fiber, lubricant, graphite and Turcon® filled Color: Dark gray	M15	NBR 70	N	-30 to +100	Hardend steel	30
		NBR 70 Low temp.	T	-45 to +80		
		FKM 70	V	-10 to +200		
		HNBR 70	H	-30 to +150		
Turcon® M30 For lubricating and non-lubricating fluids and gases Good wear and extrusion resistance Suited to high temperature service Tight surface structure Good sealing performance Suited to softer surfaces For swiveling and low velocity rotary service only Aromatic polymer, graphite, Turcon® filled; Color: Dark green-gray.	M30	NBR 70	N	-30 to +100	Steel	30
		NBR 70 Low temp.	T	-45 to +80	Hardend steel Stainless steel	
		FKM 70	V	-10 to +200	Titanium	
		HNBR 70	H	-30 to +150	HVOF Tungsten carbide	

Table is continued on next page

Material, Applications, Properties	Code	O-Ring Material Shore D	Code	Service Temp.* °C	Mating Surface Material	MPa max. Dynamic
Turcon® T10 For lubricating and non-lubricating fluids and gases Suitable for slow rotary service in lubricating fluid High extrusion resistance Not for electrically conducting fluids Carbon, graphite filled Color: Black	T10	NBR 70	N	-30 to +100	Steel Hardend steel Chrome-plated steel (rod) Stainles steel	30
		NBR 70 Low temp.	T	-45 to +80		
		FKM 70	V	-10 to +200		
		EPDM 70	E	-45 to +145		
Turcon® T40 All-round material for rotary and turning movements Good wear resistance and service life with both lubricating and non-lubricating fluids Surface texture less suited to gas sealing Carbon fiber filled Color: Gray.	T40	NBR 70	N	-30 to +100	Hardend steel Hard Alloys	30
		NBR 70 Low temp.	T	-45 to +80		
		FKM 70	V	-10 to +200		
		HNBR 70	H	-30 to +150		
Zurcon® Z80 For lubricating and non-lubricating fluids and gases High abrasion and extrusion resistance Well suited to abrasive mating surfaces and fluids For swiveling and intermittent low velocity rotary service only Good chemical resistance Ultra-high molecular weight polyethylene Color: White to off-white	Z80	NBR 70	N	-30 to +80	Steel Hardend steel Ceramic coatings HVOF Tungsten carbide	30
		NBR 70 Low temp.	T	-45 to +80		

* Service temperatures are only valid when using hydraulic mineral oil. Note that frictional heat may cause increased temperatures at the seal.

Recommended material.

Note:

Rotary seals exert high loads on mating surfaces and mild steels are best suited for slow or swiveling service.

As a basic principle, the hardness of the mating surface should increase with the peripheral speed, and a hardness of 60 HRC is recommended for velocities above 1 m/s. Due to the mechanical stresses imposed, a hardness depth of 0.5 mm or more is recommended to limit dimensional changes to the mating surface.

■ Installation Recommendation for Shaft

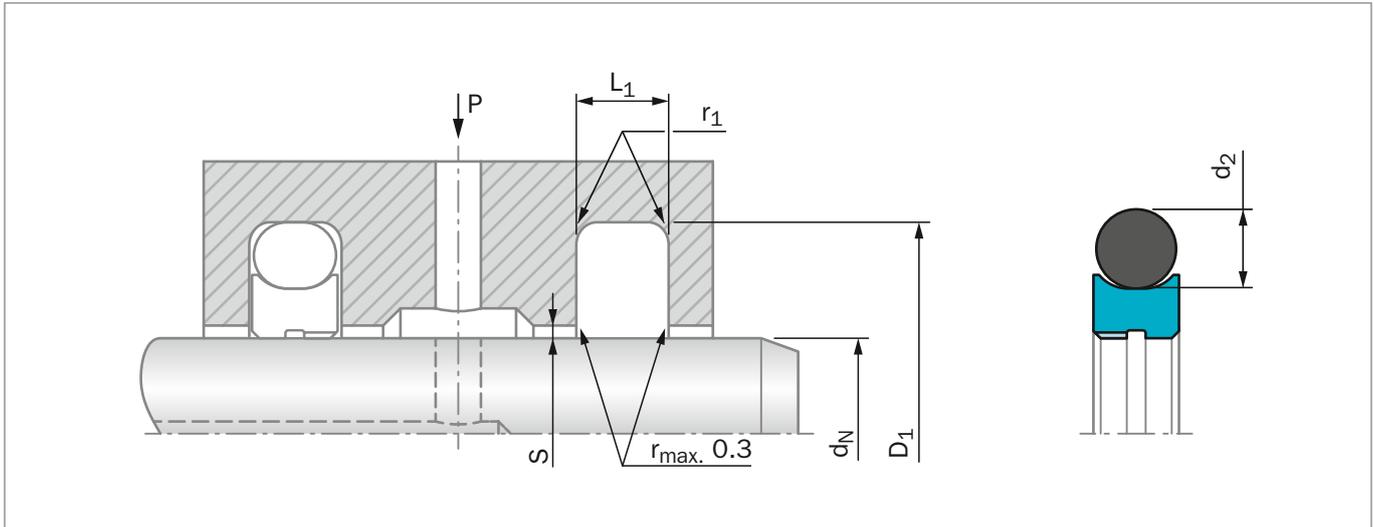

Figure 131: Installation Drawing

Table 85: Installation Dimensions – Standard Recommendations

Series Number	Shaft Diameter d_N f8/h9		Groove Diameter D_1 H9	Groove Width $L_1 +0.2$	Radius r_1	Radial Clearance S_{max}^*			O-Ring Cross-Section- \emptyset d_2	No. of Grooves in the Sealing Surface
	Recommended Range	Available Range				10 MPa	20 MPa	30 MPa		
TG31K	19 - 37.9	10 - 245.0	$d_N + 7.5$	3.20	0.60	0.20	0.15	0.10	2.62	1
TG32K	38 - 199.9	19 - 455.0	$d_N + 11.0$	4.20	1.00	0.25	0.20	0.15	3.53	1
TG33K	200 - 255.9	38 - 655.0	$d_N + 15.5$	6.30	1.30	0.30	0.25	0.20	5.33	2
TG34K	256 - 649.9	120 - 655.0	$d_N + 21.0$	8.10	1.80	0.35	0.30	0.25	7.00	2
TG35K	650 - 999.9	650 - 999.9	$d_N + 28.0$	9.50	2.50	0.40	0.35	0.30	8.40	2

* At pressures > 30 MPa: Use diameter tolerance H8/f8 (bore / shaft) in area of seal.

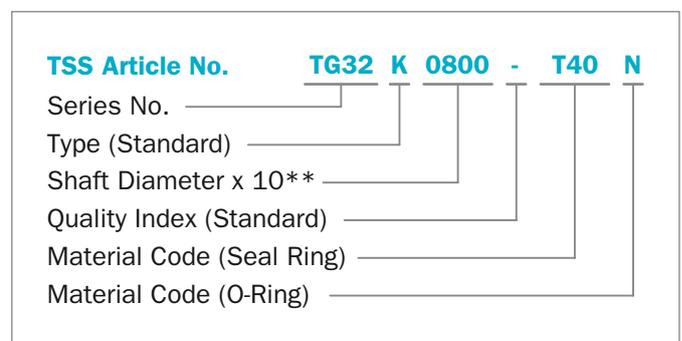

At pressures > 10 MPa it is recommendable to choose the next larger cross section according to the column "Available range" i.e. for shaft $\emptyset d_N = 80$ mm: TG33K 800-.

ORDERING EXAMPLE

Turcon® Roto Glyd Ring® K, complete with O-Ring, standard application:

Series:	TG32K (from Table 85)
Shaft diameter:	$d_N = 80$ mm
TSS Part No.:	TG32K0800 (from Table 86)

Select the material from Table 84. The corresponding code numbers are appended to the TSS Part No. Together they form the TSS Article No. The TSS Article No. for all intermediate sizes not shown in Table 86 can be determined following the example opposite.

** For diameters $d_N \geq 1,000.0$ mm only on TSS Special Article Number.

Turcon[®] Roto Glyd Ring[®] V

■ Turcon® Roto Glyd Ring® V¹⁾

■ General Description

Turcon® Roto Glyd Ring® V with pressure relief is used to seal rotary applications, such as transmission lead-throughs, journals and swivels, with rotary or oscillating movement.

The seal is double-acting and can be exposed to pressure from one, or both, sides.

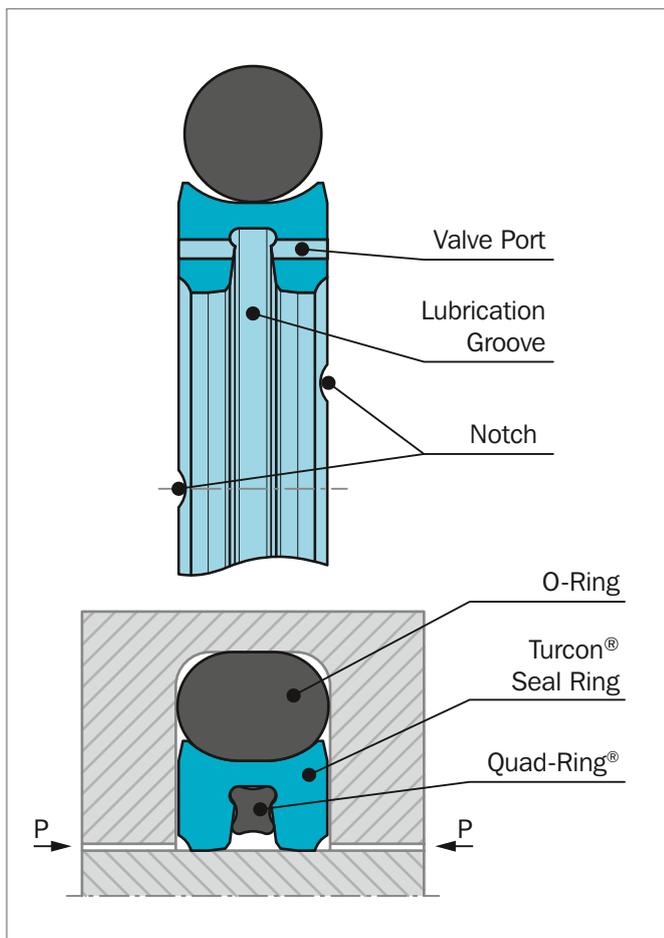

Figure 133 Turcon® Roto Glyd Ring® V with pressure relief

It consists of a seal ring of Turcon® material with an integrated elastomeric Quad-Ring® Seal (X-Ring) and is activated by an O-Ring as an elastic energizing element.

The contact surface profile of the seal ring is specially designed for use under high pressures and sliding speeds of up to 2 m/s.

1) Patent pending: PCT/EP2016/058798

VALVE PORTS

When the system pressure is higher than the pressure in the circumferential lubricating groove, the system pressure bypasses the Quad-Ring® via the valve ports and pressure balances the seal, see Figure 134.

NOTCH

To assure that a rapid activation of the seal takes place at sudden changes of pressure and direction of motion, radial notches are machined on both sides of the seal ring.

METHOD OF OPERATION

The double-acting performance of the seal follows from the symmetrical cross-section, which allows the seal to respond to pressure in both directions.

Initial contact pressure is provided by radial compression of the O-Ring. When the system pressure is activated, the O-Ring transforms this into additional radial seal contact pressure on the mating surface and thereby automatically adjusts the sealing force to ensure high sealing performance under all service conditions.

The Turcon® seal ring profile is supported by two “legs” to reduce contact area with the shaft or bore and thereby decrease friction (torque) and wear.

When exposed to pressure from one side, ports through the sidewalls permit system pressure to deform the Quad-Ring®, which opens to the lubrication groove, see Figure 134. At this point, only one “leg” of Roto Glyd Ring® V is in full pressurized contact with the counter surface and pressure is balanced around half of the dynamic contact area. The other “leg” is just obtaining a minor part of the pressure, which is mainly coming from the initial O-Ring compression – with the result of a major reduction in frictional heat generation.

Reduced contact surfaces under all operating conditions significantly improve friction and wear characteristics.

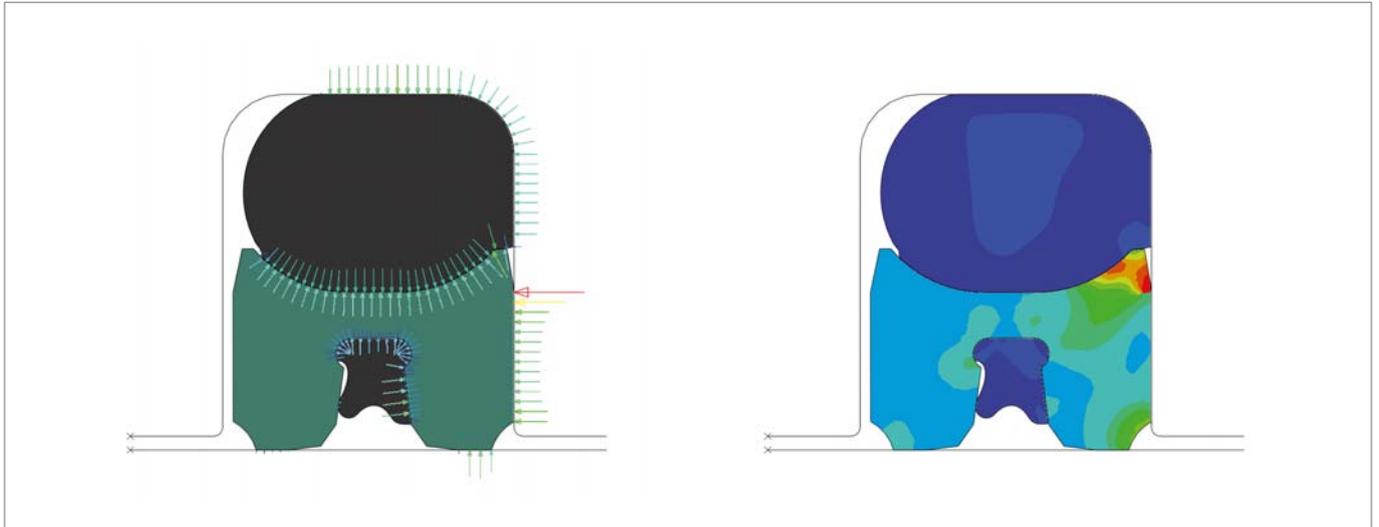

Figure 134 Turcon® Roto Glyd Ring® V - Finite Element Analysis (FEA).

In Figure 134, the system pressure is acting on the left side of the seal and has, via the valve ports, deformed the Quad-Ring® and balanced pressure over half of the dynamic contact area of the seal. The full system pressure is then only interacting on the right leg.

ADVANTAGES

- Available for shaft and bore sealing applications
- Low to high pressure
- Low to medium speed
- Low friction
- Stick-slip-free starting, no sticking
- High abrasion resistance and dimensional stability
- Simple groove design, small groove dimensions
- Recommended Turcon® materials: M15, M30, M04, T40 and Zurcon® Z80 for all shaft sizes from 35 mm and all bore sizes from 22 mm up to diameter 500 mm

TYPICAL APPLICATIONS

Roto Glyd Ring® V is used as a double-acting rotary seal for hydraulic and pneumatic equipment in applications such as:

- Rotary distributors and unions
- Rotary transmission lead-troughs
- Rotary connections with swivel movement, e.g. damping units
- High pressure valve stems
- Manipulators
- Pivoting motors in mobile hydraulics and machine tools
- Hydraulic motors
- Blow molding machines
- Top drives
- Rotary index tables
- Core cutting equipment

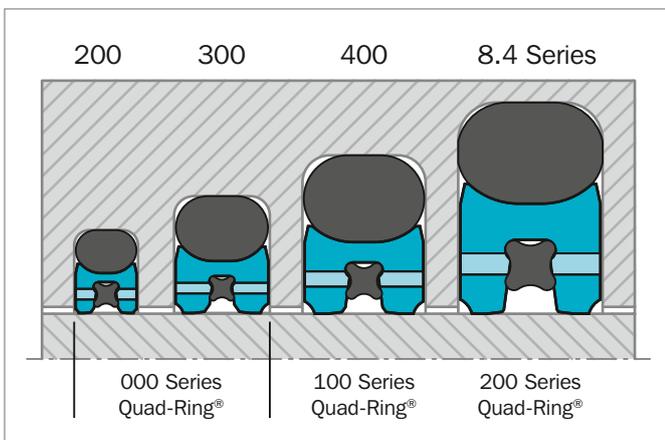

Figure 135 Cross-section profiles of available standard seal series for shaft and bore sealing dependent on Series No.

OPERATING CONDITIONS

Seal performance is influenced by such factors as lubrication capability of the sealed media and heat dissipation in the hardware, it follows that testing should always be made.

With good lubrication, the following values can be assumed as a guideline:

Pressure:	Up to 20 MPa at continuous rotation To 30 MPa at slow turning motion According to temperature and seal material
Temperature:	-45 °C to +130 °C*) Dependent on seal ring, O-Ring and Quad-Ring® material
Speed:	Up to 2 m/s According to pressure, temperature and seal material
PV:	Up to 10 MPa m/s The value must be reduced for diameters < 50 mm
Acceleration:	Up to 0.9 m/s ² , in other cases contact your local Trelleborg Sealing Solutions marketing company.
Media:	Mineral oil-based hydraulic fluids, flame-retardant hydraulic fluids, environmentally friendly hydraulic fluids (bio-oils) and others, depending on seal and elastomer material For sealing e.g. coolants, water or air use T40 or Z80

NOTE

For continuous operation at temperatures over +100 °C, pressure and speed must be limited and use of O-Rings / Quad-Ring® in HNBR or FKM

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also depends on media.

*) IMPORTANT NOTE FOR THE BORE VERSION:

In case of unpressurized applications in temperatures below 0 °C please contact your local Trelleborg Sealing Solutions marketing company for more information.

MATING SURFACE MATERIALS

Sealing of applications with rotating movements requires very good mating surfaces.

A minimum hardness of 55 HRC to a hardening depth of at least 0.5 mm is recommended - at higher speed and/or pressure 60 to 64 HRC and a depth of 0.5 to 1.0 mm is recommended.

Particular attention must be paid to avoid coatings and plating's, e.g. ceramic surfaces with poor heat dissipation and (hard) chrome where material Turcon® M30 and Zurcon® Z80 are recommended.

FRICIONAL POWER

Guide values for the frictional power P can be determined from the graph in Figure 136.

They are shown as a function of the sliding speed and operating pressure for a shaft diameter d_N of 50 mm with an oil temperature of +60 °C.

Formula for other diameters d_N :

$$\text{Frictional power } P = \frac{P_{50} \times d_N}{50 \text{ mm}} \text{ [W]}$$

Find P_{50} for Turcon® M15 in the diagram Figure 136

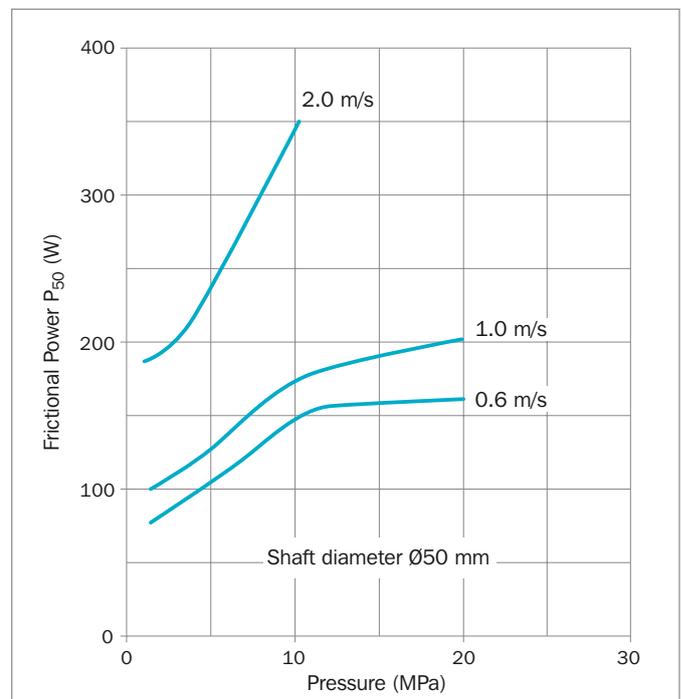

Figure 136 Frictional power for Turcon® Roto Glyd Ring® V in Turcon® M15

The guide values apply for constant operating conditions. Changes in operating condition, such as pressure fluctuations or alternating directions of shaft rotation, can result in considerably higher friction values.

RECOMMENDED MATERIALS

The following material combinations have proven effective for applications with high pressure and medium rotary speed:

Roto Glyd Ring® V in Turcon® M15

Standard material for Roto Glyd Ring® V.

For applications where high sealing efficiency, low friction and good wear resistance are important.

O-Ring: NBR 70 Shore A N
 FKM 70 Shore A V
 (Choice of O-Ring / Quad-Ring®
 depends on media and temperature)

Set code: M15N or M15V

Roto Glyd Ring® V in Turcon® M30

A material that combines high sealing performance, low friction, long service life with good wear and extrusion resistance.

Suitable for hard and softer mating surfaces

O-Ring: NBR 70 Shore A N
 FKM 70 Shore A V
 (Choice of O-Ring / Quad-Ring®
 depends on media and temperature)

Set code: M30N or M30V

Roto Glyd Ring® V in Turcon® M04

An improved carbon-filled material for linear and rotary applications which can run on softer mating surfaces.

O-Ring: NBR 70 Shore A N
 FKM 70 Shore A V
 (Choice of O-Ring / Quad-Ring®
 depends on media and temperature)

Set code: M04N or M04V

Roto Glyd Ring® V in Turcon® T40

Preferred for fluid applications where service life and wear resistance are more important than 100% sealing performance.

For fluids with high and low lubricating properties.

Preferred material for water based fluids

O-Ring: NBR 70 Shore A N
 FKM 70 Shore A V
 (Choice of O-Ring / Quad-Ring®
 depends on media and temperature)

Set code: T40N or T40V

For specific applications, other material combinations are available.

**Table 89: Turcon® Roto Glyd Ring® V**

Material, Applications, Properties	Code	O-Ring Material Shore D	Code	Service Temp. * °C	Mating Surface Material	MPa max. Dynamic
Turcon® M04 For lubricating and non-lubricating fluids and gases Smooth and tight surface texture Good sealing performance Suitable for softer mating surfaces High extrusion resistance For swiveling and low velocity rotary service only Carbon filled Color: Black	M04	NBR 70	N	-30 to +100	Steel Hardened steel	20
		NBR 70 Low temp.	T	-45 to +80		
		FKM 70	V	-10 to +200		
		HNBR 70	H	-30 to +150		
Turcon® M15 Preferred material for rotary motion For lubricating fluids Tight surface texture Good sealing performance Very good wear properties Low friction Good extrusion resistance Suited to softer mating surfaces Polyaramide, mineral fiber, lubricant, graphite and Turcon® filled Color: Dark gray	M15	NBR 70	N	-30 to +100	Hardened steel	20
		NBR 70 Low temp.	T	-45 to +80		
		FKM 70	V	-10 to +200		
		HNBR 70	H	-30 to +150		
Turcon® M30 For lubricating and non-lubricating fluids and gases Good wear and extrusion resistance Suited to high temperature service Tight surface structure Good sealing performance Suited to softer surfaces For swiveling and low velocity rotary service only Aromatic polymer, graphite, Turcon® filled Color: Dark green-gray	M30	NBR 70	N	-30 to +100	Steel Hardened steel Stainless steel Titanium HVOF Tungsten carbide	30
		NBR 70 Low temp.	T	-45 to +80		
		FKM 70	V	-10 to +200		
		HNBR 70	H	-30 to +150		

Material, Applications, Properties	Code	O-Ring Material Shore D	Code	Service Temp.* °C	Mating Surface Material	MPa max. Dynamic
Turcon® T40 All-round material for rotary and turning movements Good wear resistance and service life with both lubricating and non-lubricating fluids Surface texture less suited to gas sealing Carbon fiber filled Color: Gray.	T40	NBR 70	N	-30 to +100	Hardened steel Hard alloys	20
		NBR 70 Low temp.	T	-45 to +80		
		FKM 70	V	-10 to +200		
		HNBR 70	H	-30 to +150		
Zurcon® Z80 For lubricating and non-lubricating fluids and gases High abrasion and extrusion resistance Well suited to abrasive mating surfaces and fluids For swiveling and intermittent low velocity rotary service only Good chemical resistance Ultra-high molecular weight polyethylene Color: White to off-white	Z80	NBR 70	N	-30 to +80	Steel Hardened steel Ceramic coatings HVOF Tungsten carbide	30
		NBR 70 Low temp.	T	-45 to +80		

* Service temperatures are only valid when using hydraulic mineral oil. Note that frictional heat may cause increased temperatures at the seal.

Recommended material.

Note:

Rotary seals exert high loads on mating surfaces and mild steels are best suited for slow or swiveling service.

As a basic principle, the hardness of the mating surface should increase with the peripheral speed, and a hardness of 60 HRC is recommended for velocities above 1 m/s. Due to the mechanical stresses imposed, a hardness depth of 0.5 mm or more is recommended to limit dimensional changes to the mating surface.

QUAD-RING® MATERIALS

Standard materials for Quad-Ring® :

NBR 70 Shore A: Material code N7004
 FKM 70 Shore A: Material code V7002s

Further special materials on request.

As standard, the Quad-Ring® in NBR elastomer is pre-installed in the circumferential lubrication groove of the Turcon® seal ring – attention must be paid to the medium compatibility and temperature limit of NBR.

If another elastomer material is required, Roto Glyd Ring® V is delivered with the Quad-Ring® uninstalled.

To get Roto Glyd Ring® V **without** Quad-Ring® in NBR, use the feature code [W] in the 5th character in the TSS Article No, See ordering example page 261 or page 264.

■ Recommended Installation for Shaft

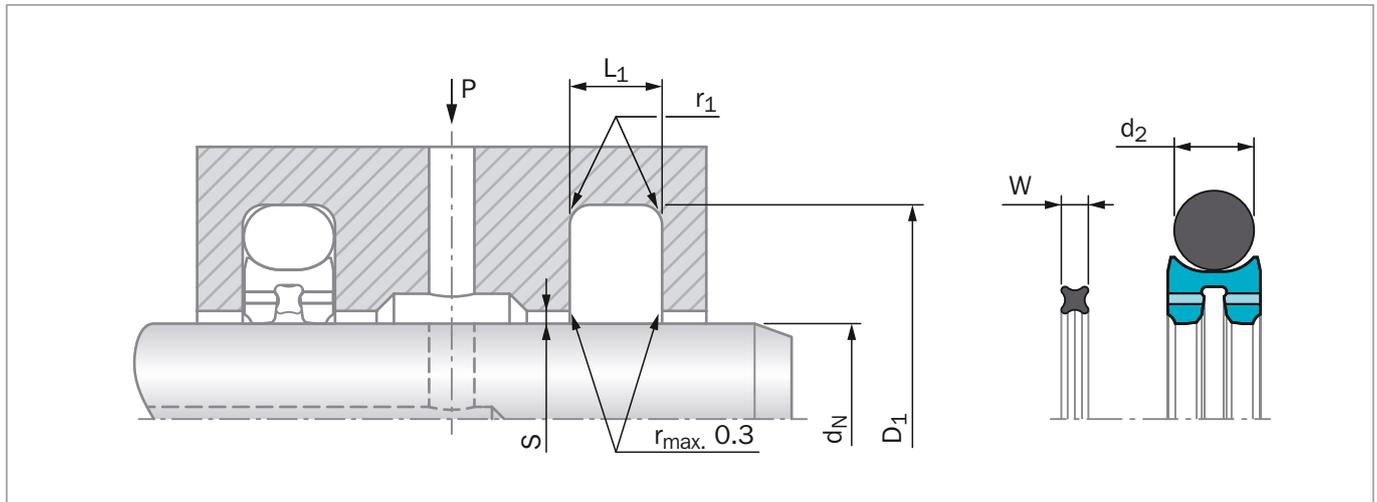

Figure 137 Installation Drawing

Table 90: Installation Dimensions – Standard Recommendations

Series Number	Shaft Diameter d_N f8/h9		Groove Diameter D_1 H9	Groove Width L_1 +0.2	Radius r_1	Radial Clearance S_{max}^*			O-Ring Cross-Section-Ø d_2	Quad-Ring® Cross-Section-Ø W
	Standard Application	Available Range				10 MPa	20 MPa	30 MPa		
TG720	35 - 79.9	35 - 144.9	$d_N + 11.0$	4.2	1.0	0.40	0.25	0.15	3.53	1.78
TG730	80 - 144.9	38 - 144.9	$d_N + 15.5$	6.3	1.3	0.50	0.30	0.20	5.33	1.78
TG740	145 - 269.9	80 - 269.9	$d_N + 21.0$	8.1	1.8	0.60	0.35	0.25	7.00	2.62
TG750	270 - 500	200 - 500	$d_N + 28.0$	9.5	2.5	0.70	0.40	0.30	8.40	3.53

* At pressures > **30 MPa** use diameter tolerance H8/f8 (bore/rod) in the area of the seal or consult your local Trelleborg Sealing Solutions marketing company for alternative material or profiles.
Slydring® / Wear Rings are not applicable at very small radial clearances, please consult the Slydring® catalog.

ORDERING EXAMPLE

Roto Glyd Ring® V, complete with Quad-Ring® in NBR pre-installed and O-Ring, standard application:

Series: TG730 from Table 90

Shaft diameter: $d_N = 80.0$ mm

TSS Part No.: TG7300800

Select the material from Table 89. The corresponding code numbers are appended to the TSS Part No. (from Table 91). Together these form the TSS Article Number. The TSS Article Number for all intermediate sizes can be determined following the example:

TSS Article No.	TG73	0	0800	-	M15	N
Series No.	_____	_____	_____	_____	_____	_____
Type (Standard)**	_____	_____	_____	_____	_____	_____
Shaft Diameter x 10***	_____	_____	_____	_____	_____	_____
Quality Index (Standard)	_____	_____	_____	_____	_____	_____
Material Code (Seal Ring)	_____	_____	_____	_____	_____	_____
Material Code (O-Ring)	_____	_____	_____	_____	_____	_____

** Ordering Roto Glyd Ring® V **without** NBR Quad-Ring® please use suffix "W" in the fifth character TG73**W**00800-

*** For diameters $d_N > 500$ mm only on TSS Special Article Number.

Table 91: Standard Installation Dimensions / TSS Part No.

Shaft Diameter	Groove Diameter	Groove Width	TSS Part No.	O-Ring Dimension	Quad-Ring® Dimension

The bore diameters printed in **bold** type conform to the recommendations of ISO 3320.

Other dimensions and all intermediate sizes up to 500 mm diameter including imperial (inch) sizes can be supplied.

Zurcon[®] Roto Glyd Ring[®] S

Zurcon® Roto Glyd Ring® S

General Description

Zurcon® Roto Glyd Ring® S is used to seal rotary transmission lead-throughs journals, swivels and with rotary or oscillating movement.

The seal is double-acting and can be exposed to pressure from one, or both, sides.

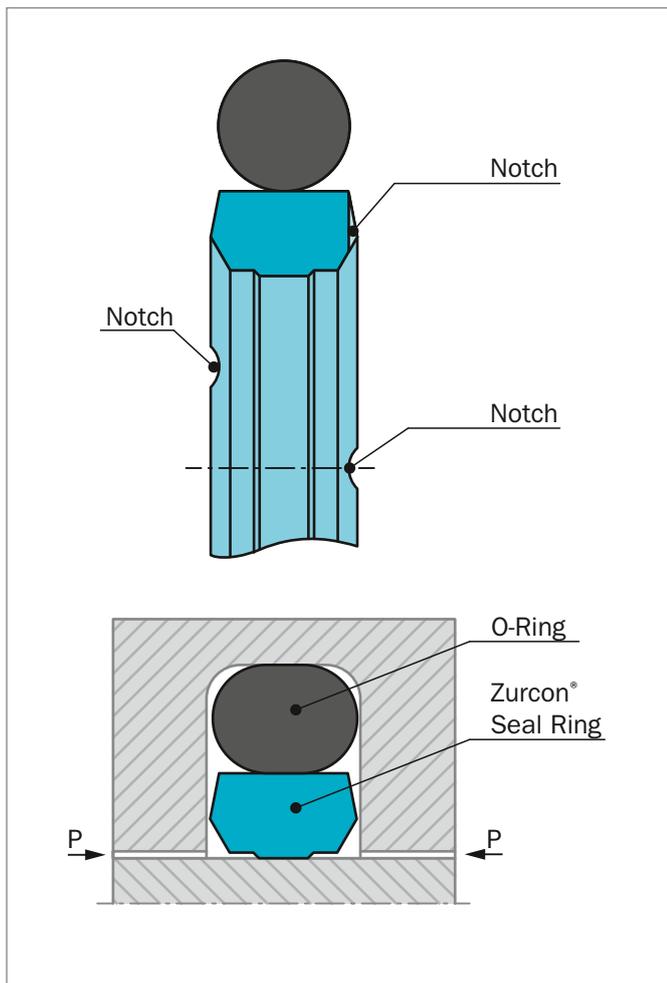

Figure 139 Zurcon® Roto Glyd Ring® S

It consists of a seal ring of Zurcon® material and is activated by an O-Ring as an elastic energizing element.

The contact surface profile of the seal ring is specially designed for use under high pressures and at low sliding speeds.

Pat. pending: DE 101 45914 A1
WO 03/027545 A1

METHOD OF OPERATION

Reduced contact surfaces under all operating conditions significantly improve friction and wear characteristics. When exposed to low pressure, only the central section of the seal comes into contact with the mating surface.

As the system pressure increases, the seal ring is tilted slightly generating the hydrostatic pressure balance in the sealing gap. Tilting the ring under pressure optimizes the lubrication between the seal and the mating surface.

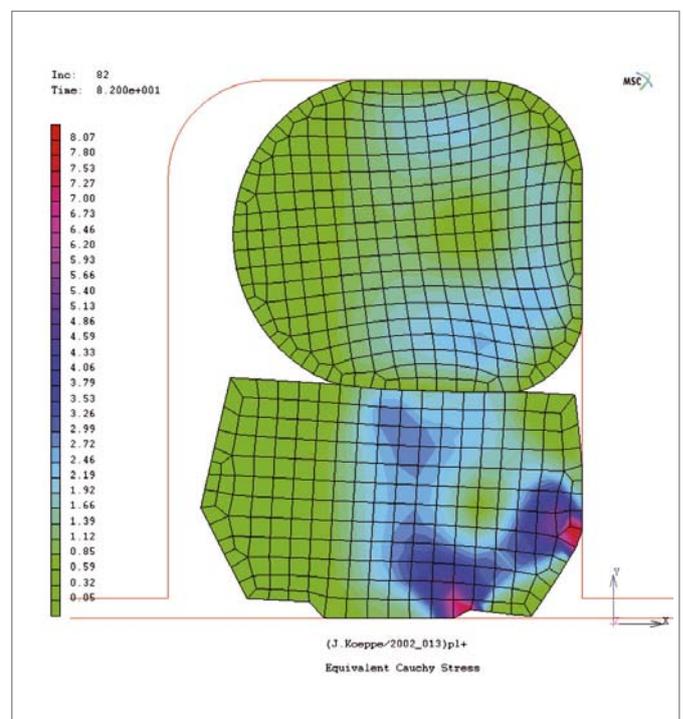

Figure 140 Zurcon® Roto Glyd Ring® S - Finite Element Analysis (FEA)

The profile is supported by a second edge which restricts contact with the shaft or bore, thereby significantly reducing friction and wear. The O-Ring material can be adapted to suit operating conditions. The angle on both sides of Zurcon® Seal Ring prevents extrusion into the system gap.

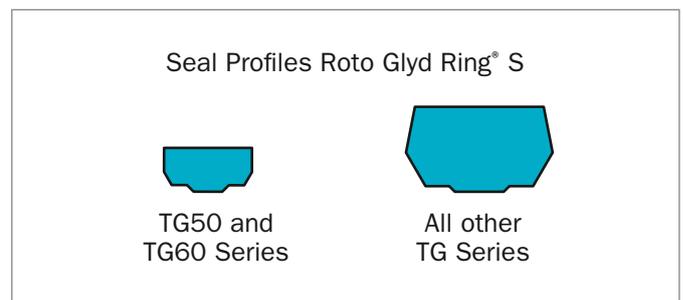

Figure 141 Cross-section profiles depending on Series No.

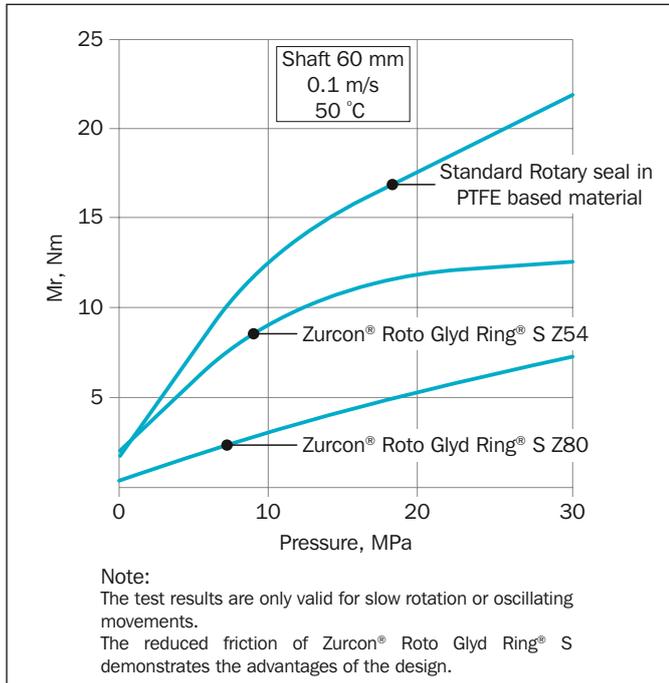

Figure 142 Friction of seals after endurance test

NOTCH

To assure that rapid activation of the seal takes place at sudden changes of pressure and direction of motion, radial notches are machined on both sides of the seal ring.

ADVANTAGES

- Available for shaft and bore sealing applications
- Low to high pressure
- Low friction
- Stick-slip-free starting, no sticking
- High abrasion resistance and dimensional stability
- Simple groove design, small groove dimensions
- Available in material Z53 and Z54 for all shaft sizes up to 2,200 mm diameter and for all bore sizes up to 2,300 mm
- Available in material Z80 for all shaft sizes up to 2,600 mm diameter and for all bore sizes up to 2,700 mm.

APPLICATION EXAMPLES

- Shafts, axels and rotary transmission lead-throughs.
- Rotary indexing tables
- Rotary connections with swivel movement, e.g. damping units

OPERATING CONDITIONS

Pressure:	Up to 40 MPa
PV:	Up to 6.5 MPa x m/s
Acceleration:	Up to 0.9 m/s ² , in other cases contact your local Trelleborg Sealing Solutions marketing company.
Temperatures:	-30 °C to +100 °C
Media:	Mineral oil-based hydraulic fluids, flame-retardant hydraulic fluids, environmentally friendly hydraulic fluids (bio-oils) and others, depending on seal and elastomer material. For sealing e.g. coolants, water or air use Z80.

NOTE

For continuous operation at temperatures over +60 °C, pressure and speed must be limited.

Table 94: Material

Material	Pressure P MPa	P x V MPa x m/s	Temperature t° °C
Zurcon® Z53*	40	6.5	-30/+100
Zurcon® Z54	25	6.5	-30/+100
Zurcon® Z80	30	6.5	-30/+80

*Zurcon® Z53 only for p >30 MPa

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure, temperature and value gap.

INSTALLATION INSTRUCTIONS

Roto Glyd Ring® S is installed according to information at page 313.

Closed groove installation according to dimensions at Table 96 on page 273.

RECOMMENDED MATERIALS

The following material combinations have proven effective for applications with slow turning movements:

Roto Glyd Ring® S in Zurcon® Z80

All round material:

O-Ring: NBR 70 Shore A N
 FKM 70 Shore A V
 (according to media)

Set code: Z80N or Z80V

Roto Glyd Ring® S in Zurcon® Z54

Material for high sealing effect:

O-Ring: NBR 70 Shore A N

Set code: Z54N

For specific applications, other material combinations are available.

Table 95: Zurcon® Roto Glyd Ring® S

Material, Applications, Properties	Code	O-Ring Material Shore D	Code	Service Temp. * °C	Mating Surface Material	MPa max. Dynamic
Zurcon® Z53** For lubricating hydraulic fluids Very high abrasion and extrusion resistance Good sealing performance Well suited to abrasive mating surfaces For swiveling and intermittent low-velocity rotary service only Limited chemical resistance Maximum service temperature: +110 °C Cast polyurethane Color: Yellow to light brown	Z53	NBR 70	N	-30 to +100	Hardend steel	40
		NBR 70 Low temp.	T	-45 to +80	Chrome-plated steel (shaft) Ceramic coatings Stainless steel	
Zurcon® Z54** For lubricating hydraulic fluids Very high abrasion resistance Good sealing performance Well suited to abrasive mating surfaces. For swiveling and intermittent low-velocity rotary service only Maximum service temperature: +110 °C Cast polyurethane Color: Turquoise	Z54	NBR 70	N	-30 to +100	Steel	25
		NBR 70 Low temp.	T	-45 to +80	Hardend steel Chrome-plated steel (shaft) Ceramic coating Stainless steel	
Zurcon® Z80 For lubricating and non-lubricating fluids and gases High abrasion and extrusion resistance Well suited to abrasive mating surfaces and fluids For swiveling and intermittent low-velocity rotary service only Good chemical resistance Ultra-high molecular weight polyethylene Color: White to off-white	Z80	NBR 70	N	-30 to +80	Steel	30
		NBR 70 Low temp.	T	-45 to +80	Hardend steel Ceramic coatings HVOF Tungsten carbide	

* Service temperatures are only valid when using hydraulic mineral oil. Note that frictional heat may cause increased temperatures at the seal.

** Maximum diameter 2,200 mm

Note:

Rotary seals exert high loads on mating surfaces and mild steels are best suited for slow or swiveling service.

As a basic principle, the hardness of the mating surface should increase with the peripheral speed, and a hardness of 60 HRC is recommended for velocities above 1 m/s. Due to the mechanical stresses imposed, a hardness depth of 0.5 mm or more is recommended to limit dimensional changes to the mating

■ Installation Recommendation for Shaft

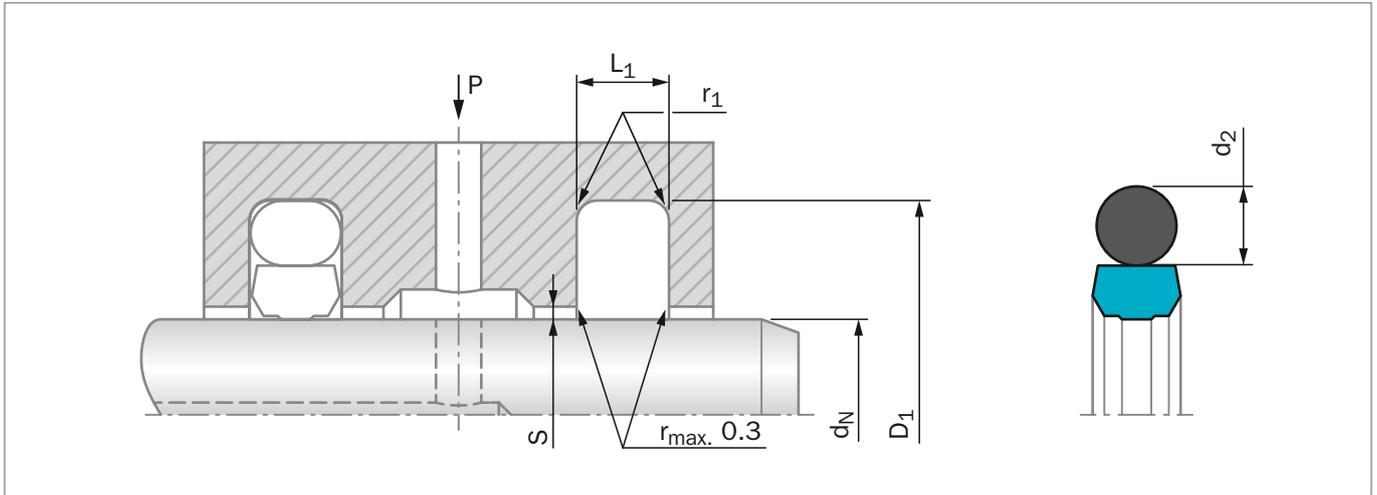

Figure 143 Installation Drawing

Table 96: Installation Dimensions – Standard Recommendations

Series Number	Shaft Diameter d_N f8/h9		Groove Diameter*	Groove Width	Radius	Radial Clearance S_{max} *		O-Ring Cross-Section-Ø
	Standard Range	Available Range	D_1 H9	$L_1 +0.2$	r_1	10 MPa	30 MPa	d_2

TG55X**	1,000 - 2,600	-	$d_N + 28.0$	9.50	2.50	0.50	0.30	8.40

* For max. temperature = +60 °C at the seal.

** Z53 and Z54 max. \varnothing 2,200 mm.

ORDERING EXAMPLE

Zurcon® Roto Glyd Ring® S, complete with O-Ring, standard application:

Series:	TG52 from Table 96
Shaft diameter:	$d_N = 80.0$ mm
TSS Part No.:	TG5200800 from Table 97

Select the material from Table 95. The corresponding code numbers are appended to the TSS Part No. Together they form the TSS Article No. The TSS Article No. for all intermediate sizes not shown in Table 97 can be determined following the example opposite.

TSS Article No.	TG52 0 0800 - Z54 N
Series No.	TG52
Type (Standard)	0
Shaft Diameter x 10***	0800
Quality Index (Standard)	-
Material Code (Seal Ring)	Z54
Material Code (O-Ring)	N

*** For diameters $\geq 1,000.0$ mm multiply only by factor 1.

Example: TG55X for diameter 1,200.0 mm
TSS Article No.: TG55X**1200** - Z54N

The bore diameters printed in **bold** type conform to the recommendations of ISO 3320.

Other dimensions and all intermediate sizes up to 2,300 mm diameter for Z53 and Z54 (2,700 mm for Z80) including inch sizes can be supplied.

* Theoretical ideal O-Ring size

Turcon[®] Roto Variseal

■ Turcon® Roto Variseal®

■ Description

The Turcon® Roto Variseal® is a single-acting seal consisting of a U-shaped seal jacket and a V-shaped corrosion resistant metal spring.

The key characteristic of the Roto Variseal® is the flanged heel, which prevents the seal from rotating by clamping in the groove and the short and heavy dynamic lip offering reduced friction, long service life and a good scraping effect even in highly viscous media.

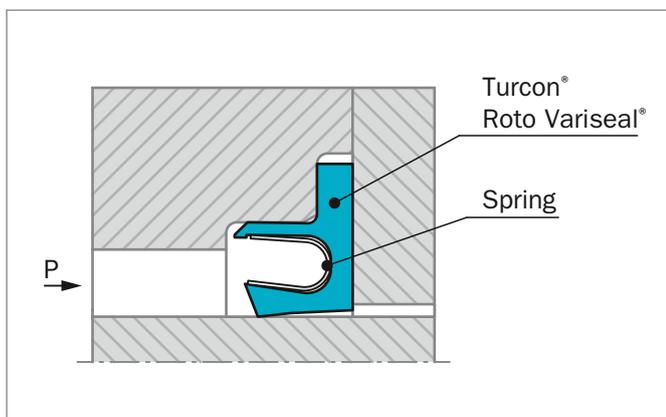

Figure 145 Turcon® Roto Variseal®

At low and zero pressure, the metal spring provides the primary sealing force. As the system pressure increases, the main sealing force is achieved by the system pressure and ensures a tight seal from zero to high pressure.

The possibility of matching suitable materials for the seal and the spring allows use in a wide range of applications going beyond the field of hydraulics, e.g. in the chemical, pharmaceutical and foodstuffs industries.

The Roto Variseal® can be sterilized and is available in a special Hi-Clean version where the spring cavity is filled with a Silicone elastomer preventing contaminants from being entrapped in the seal. This design also works well in applications involving mud, slurries or adhesives to keep grit from packing into the seal cavity and inhibiting the spring action.

ADVANTAGES

- Suitable for rotary, reciprocating and static applications
- Protects against mechanical torsion
- Low coefficient of friction
- Remains tight in groove even when subject to oscillating or helical movements
- Withstands rapid changes in temperature
- High abrasion resistance
- Excellent resistance to aging
- Good scraping ability
- Can be sterilized
- Available in Hi-Clean version

OPERATING CONDITIONS

Operating Pressure:	For dynamic loads: 20 MPa For static loads: 25 MPa
Speed:	Rotating: Up to 2 m/s
Temperature:	-70 °C to +300 °C For specific applications at lower temperatures, please enquire
Media:	Virtually all fluids, chemicals and gases

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure and temperature.

FRICITIONAL FORCE

Indicative values for frictional force are included in Figure 146. Frictional force is given as a function of sliding speed and operating pressure for a shaft diameter of 50 mm at an oil temperature of 60 °C. The operating limits are lower at higher temperatures.

Indicative values for other shaft diameters can be calculated from the formula:

$$P \approx P_{50} \times \left(\frac{d}{50 \text{ mm}} \right) [W]$$

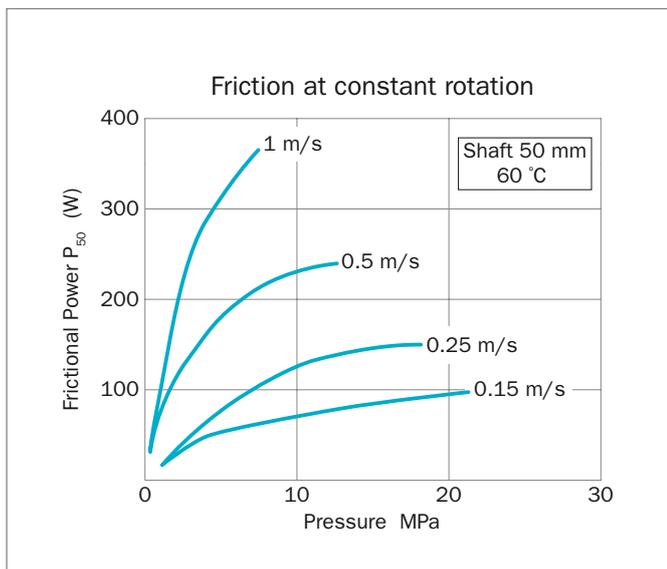

Figure 146 Frictional power for Turcon® Roto Variseal®

The indicative values apply for constant operating conditions. Changes in these, such as pressure fluctuations or direction of rotation can result in significantly higher frictional values.

APPLICATION EXAMPLES

The Turcon® Roto Variseal® is used as a single acting rotary seal in sectors such as:

- Rotary injection units (injection molding machines)
- Rotary distributors
- Pivoting motors in pharmacy, industry, machine tools, foodstuff and chemical

APPLICATION LIMITS

The maximum operating limits for temperature, pressure and speed are dependent upon one another and therefore cannot all apply at the same time.

The lubrication properties of the media to be sealed and heat dissipation must also be taken into consideration.

The following pv values can be used as general guidelines:

Poor lubrication up to $p v = 2 \text{ MPa} \times \text{m/s}$

Good lubrication up to $p v = 5 \text{ MPa} \times \text{m/s}$

Very good cooling up to $p v = 8 \text{ MPa} \times \text{m/s}$

These values are lower for diameters < 50 mm (2 inches). Tests of these characteristics are recommended to establish application limits.

MATERIALS

All materials used are physiologically safe. They contain no odour or taste-affecting substances.

The following standard material combination has proved effective for most applications:

Seal ring: Turcon® T40
Spring: Stainless Steel Material No. AISI 301

For use in accordance with the demands of the "Food and Drug Administration", suitable materials are available on request.

LEAD-IN CHAMFERS

In order to avoid damage during installation, lead-in chamfers and rounded edges must be provided on the housing and on the rod (Figure 147). If this is not possible for design reasons, a separate installation tool is recommended.

The minimum length of the lead-in chamfer depends on the profile size of the seal and can be seen from the following tables. If concentricity between the parts is not ensured during installation the lead-in chamfers must be increased correspondingly.

For the surface quality of the lead-in chamfer, the same recommendations apply as given for the sealing surfaces in Table 102.

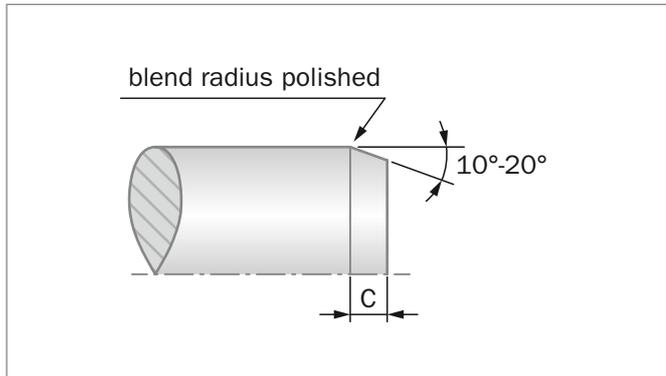

Figure 147 Lead-in chamfer on shaft

Table 100: Lead-in chamfers for Turcon® Roto Variseal®

Series	Lead-in Chamfers Length C min.
TVM1	4.5
TVM2	5.0
TVM3	8.0
TVM4	12.0

MATING SURFACE MATERIALS

Sealing of applications with rotating movements require very good mating surfaces. A minimum hardness 55 HRC is recommended to a harding depth of at least 0.3 mm. Particular attention must be paid to coated surfaces and good heat dissipation through the coating is required.

SHAFT BEARING/RADIAL CLEARANCE FOR BEARING

In general, the sealing elements should not take on any bearing tasks as this will reduce the functioning of the seals. Consequently we recommend to guide the components by means of a roller or slide bearing.

INSTALLATION INSTRUCTIONS

The following points should be observed before installation of the seals:

- Check whether housing or rod has a lead-in chamfer; if not, use an installation sleeve
- Deburr and chamfer or round sharp edges, cover the tips of any screw threads
- Remove machining residues such as chips, dirt and other foreign particles and carefully clean all parts
- If the seals are installed with grease or oil, attention must be paid to the compatibility of the seal materials with these lubricants. Use only grease without solid additives (e.g. molybdenum disulfide or zinc sulfide)
- Do not use installation tools with sharp edges

INSTALLATION OF TURCON® ROTO VARISEAL®

Turcon® Roto Variseal® is installed in split grooves.

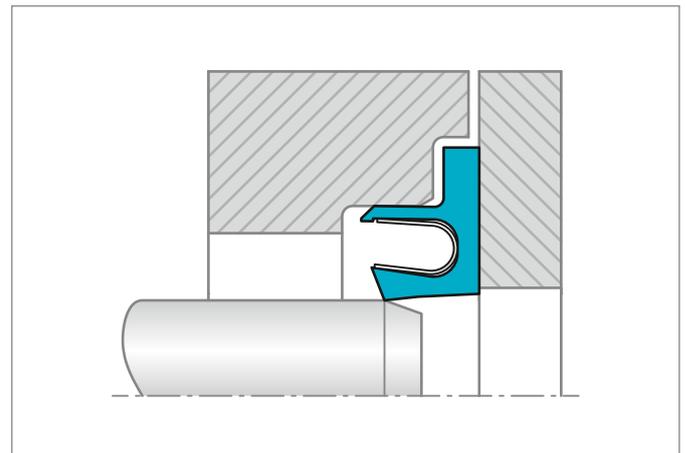

Figure 148 Turcon® Roto Variseal®

Installation should be performed in the following steps in order to ensure a concentric and strain-free fit:

- Place the seal ring in into the open groove
- Fit the cover loosely onto the housing
- Insert the shaft
- Tighten the cover

Table 101: Standard Turcon® Materials for Roto Variseal®

Material, Applications, Properties	Code	Spring Material	Code	Operating Temp.* °C	Mating Surface Material	MPa max.
Turcon® T40 For all lubricating and non-lubricating Hydraulic fluids, water hydraulics, soft mating surfaces Carbon fiber filled Color: Gray	T40	Spring material AISI 301	S	-100 to +260	Steel Steel, chrome plated Cast iron Stainless steel Aluminum Bronze Alloys	15
Turcon® T78 For all lubricated and non-lubricated applications, soft mating surfaces Aromatic polymer Color: Tan to dark brown	T78	Spring material AISI 301	S	-100 to +260	Steel Steel, chrome plated Cast iron Stainless steel	5

Highlighted materials are standard.

Trelleborg Sealing Solutions recommends that the following surface finishes be observed:

Table 102: Surface Roughness

Media	Shaft surface ¹⁾	Static groove surface
Cryogenic and low molecular gases Hydrogen, Helium, Freon, Oxygen Nitrogen	Rmax = 1.0 µm Rz = 0.63 µm Ra = 0.1 µm	Rmax = 3.5 µm Rz = 2.2 µm Ra = 0.3 µm
Low viscosity fluids Water, Alcohols, Hydrazine, Gaseous nitrogen, Natural gas, Skydrol, air	Rmax = 2.5 µm Rz = 1.6 µm Ra = 0.2 µm	Rmax = 5.0 µm Rz = 3.5 µm Ra = 0.6 µm
High viscosity fluids Hydraulic oils, Crude oil, Gear oil, Sealants, Glue, Milk products	Rmax = 2.5 µm Rz = 1.6 µm Ra = 0.2 µm	Rmax = 6.5 µm Rz = 5.0 µm Ra = 0.8 µm

1) The sealing surface must be free from spiral grooves.
 The material contact area Rmr should be approx. 50 to 70%, determined at a cut depth c = 0.25 x Rz, relative to a reference line of C_{ref.} 5%.

■ Installation Recommendation

ORDERING EXAMPLE TURCON® ROTO VARISEAL®

Series:	TVM3 (from Table 103)
Rod Diameter:	$d_N = 80.0$ mm
TSS Part No.:	TVM300800 (from Table 104)

Select the material from Table 101. The corresponding code numbers are appended to the TSS Part No. (from Table 104). Together they form the TSS Article No. For all intermediate sizes not shown in Table 103, the TSS Article No. can be determined from the example opposite.

* For diameters $\geq 1,000.0$ mm multiply only by factor 1.
 Example: TVM4 for diameter 1,200.0 mm.
 TSS Article No.: TVM4X**1200** - T40SM.

** Roto Variseal® are available with the spring groove filled with high temperature silicone. The silicone prevents entrapment of biological contaminants in the seal making the seal easier to clean. Select R for HiClean option.

The rod diameters printed in **bold** type conform to the recommendations of ISO 3320.
 Other dimensions and all intermediate sizes up to 2,500 mm diameter including inch sizes can be supplied.

Turcon[®] Roto VL Seal[®] F

! This page is intentionally left blank.

■ Turcon® Roto VL Seal® F

■ Description

Turcon® Roto VL Seal® F is an O-Ring energized, single-acting seal intended for rotary and swivelling movements. The seal is specially designed for rotary applications with medium to high system pressure. It covers both shaft and bore installations.

It is a further development of the Turcon® Roto VL Seal® design with the extra feature of having a flange which is clammed in the groove preventing the seal from rotating, see page Figure 150.

The single-acting Roto VL Seal® F is a combination of a Turcon® based slipper seal and an energizing O-Ring. It has an interference fit, which together with the squeeze of the O-Ring, ensures a good sealing effect even at low pressure. At higher system pressures, the O-Ring is energized by the fluid pushing Turcon® Roto VL Seal® F against the sealing face with increased force.

Turcon® Roto VL Seal® F has very high static sealing ability effect in the groove provided by the O-Ring, which is protected from damage inflicted by pressure cycles by the supporting concave seal back. By clamping the flanged Turcon® Roto VL Seal® F in the groove, it is kept in position at high working pressures.

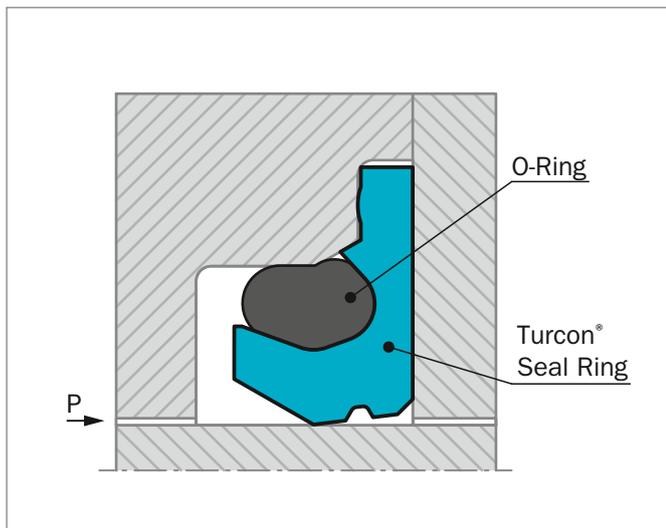

Figure 150: Turcon® Roto VL Seal® F

Roto VL Seal® F offers improved performance in terms of high dynamic seal efficiency, low friction and static sealing by an elastomer component.

ADVANTAGES

- Available for shaft and bore sealing applications
- For rotary, turning and helical movements
- Low friction
- Stick-slip-free starting, no sticking
- High static sealing effect
- High dimensional stability
- Lubricant reservoir
- Available in Turcon® and Zurcon® materials
- Available in most materials in all sizes up to 2,600 mm for shaft seals and to 2,700 mm for bore seals
- The specific O-Ring position eliminates the static seal element normally applied in a split groove assembly
- Fit into standard Turcon® Roto Variseal® grooves.

APPLICATIONS EXAMPLES

The seal is used in hydraulics and general machine construction as an alternative to other single-acting seals according to their individual advantages in:

- Rolling Mills: Bearing Grease Seals
- Tool Machine Industry, mainly Machining Centres
- Hydraulic Swivels
- Injection Moulding Machines: Rotary Injection Unit
- Valve Spindles
- Food Processing: Blender and Mixers
- Hydraulic Steering Units
- Hydraulic Rotator: Forest machines
- Rotator for Handling Devices
- Vane Actuators / Motors
- Hydraulic Motors
- Hydraulic Pumps
- Propeller Thrusters
- ROV (Remotely Operated Vehicles)

OPERATING CONDITIONS

Seal performance is influenced by factors such as lubrication capability of the sealed media and heat dissipation in the hardware. Therefore testing should always be carried out. With good lubrication, the following values can be used:

Movement:	Rotary and oscillating
Pressure:	Up to 30 MPa (40 MPa short term or static) (depending on seal material)
Speed:	Up to 2 m/s and/or 1,000 rpm according to seal material
Temperature:	Turcon® materials: -40 to +120 °C *) (+200 °C static) according to O-Ring material Zurcon® Z54: -40 to +80 °C *) (+100 °C short term or static) according to O-Ring material Zurcon® Z80: -40 to +60 °C *) (+80 °C short term or static) according to O-Ring material
Media:	Mineral oil-based hydraulic fluids, flame-retardant hydraulic fluids, environmentally friendly hydraulic fluids (bio-oils), water and others, depending on seal and elastomer material.
Availability:	Shaft diameters from 6 to 2,600 mm (2,200 for Zurcon® Z54) Bore diameters from 14 to 2,700 mm (2,300 for Zurcon® Z54)
Caution with:	Operating at temperatures above +80 °C, use O-Rings in HNBR or FKM Rotary service on shafts and bores with poor heat dissipation Shaft and bores with hardness below 50 HRC Constant rotation for Zurcon® materials

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure, temperature and gap value. Temperature range also depends on the media.

*) IMPORTANT NOTE FOR THE BORE VERSION:

In the case of unpressurized applications in temperatures below °C please contact your local Trelleborg Sealing Solutions marketing company for more information.

FRICIONAL POWER

Guide values for the frictional power (P) can be determined from the graph in page Figure 151. They are shown as a function of the sliding speed and operating pressure for a shaft diameter of 50 mm with an oil temperature of 60 °C. At higher temperatures, these application limits must be reduced.

Formula for other diameters d:

$$P = \frac{P_{50} \times (d)}{(50 \text{ mm})} \text{ [W]}$$

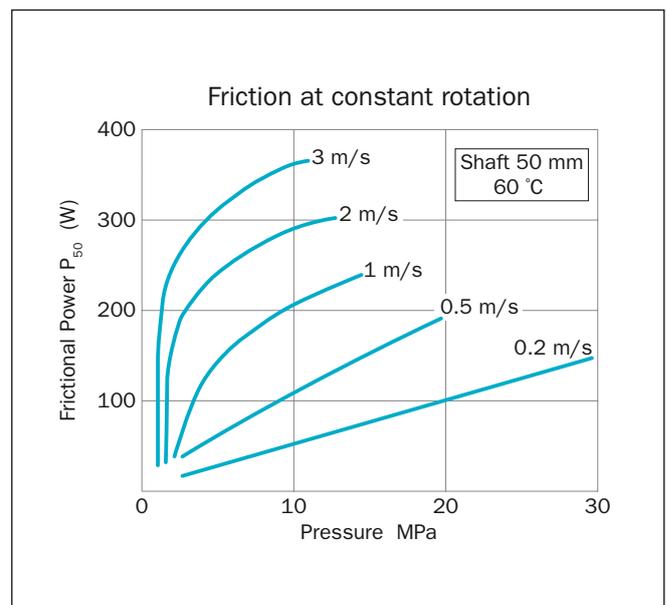

Figure 151: Frictional power for Turcon® VL Seal® F

The guide values apply for constant operating conditions. Pressure fluctuations or alternating directions of shaft rotation can result in considerably higher friction values.

INSTALLATION INSTRUCTIONS

Roto VL Seal® F is installed according to information at page 313.

O-RING SIZE

O-Rings for Roto VL Seal® F are selected to suit the groove diameter:

For shaft seals the O-Ring should have OD equal to or smaller than groove diameter, for bore seals the O-Ring should have ID equal to or smaller than groove diameter.

RECOMMENDED MATERIALS

The following material combinations have proven effective for rotary applications:

Turcon® Roto VL Seal® F in Turcon® T40

All-round material choice in oil hydraulics, water and other fluids with limited lubrication:

O-Ring:	NBR 70 Shore A	N
	FKM 70 Shore A	V
	HNBR 70 Shore A	H
Set code:	T40N, T40V or T40H	

Turcon® Roto VL Seal® F in Turcon® in M15

Material with high sealing effect for light to medium applications in fluids with good lubrication:

O-Ring:	NBR 70 Shore A	N
	FKM 70 Shore A	V
	HNBR 70 Shore A	H
Set code:	M15N, M15V or M15H	

Applications where high resistance to abrasive wear is required Zurcon® Z54 and Z80 are recommended.

Z54 and Z80 are for slow turning motion and not for constant rotation.

For specific applications other Turcon® and Zurcon® materials are available.

Table 105: Turcon® Roto VL Seal® F

Material, Applications, Properties	Code	O-Ring Material Shore D	Code	Service Temp. * °C	Mating Surface Material	MPa max. Dynamic
Turcon® M04 For lubricating and non-lubricating fluids and gases Smooth and tight surface texture Good sealing performance Suitable for softer mating surfaces High extrusion resistance For swiveling and low velocity rotary service only Carbon filled Color: Black	M04	NBR 70	N	-30 to +100	Steel	30

		HNBR 70	H	-30 to +150	Titanium HVOF Tungsten carbide	
Turcon® T40 All-round material for rotary and turning movements Good wear resistance and service life with both lubricating and non-lubricating fluids Surface texture less suited to gas sealing Carbon fiber filled; Color: Gray	T40	NBR 70	N	-30 to +100	Hardend steel	30
		NBR 70 Low temp.	T	-45 to +80	Hard alloys	
		FKM 70	V	-10 to +200		
		HNBR 70	H	-30 to +150		

Material, Applications, Properties	Code	O-Ring Material Shore D	Code	Service Temp. * °C	Mating Surface Material	MPa max. Dynamic
Zurcon® Z53** For lubricating hydraulic fluids Very high abrasion and extrusion resistance Good sealing performance Well suited to abrasive mating surfaces For swiveling and intermittent low- velocity rotary service only Limited chemical resistance Maximum service temperature: +110 °C Cast polyurethane Color: Yellow to light brown	Z53	NBR 70	N	-30 to +100	Hardend steel Chrome-plated steel (shaft) Ceramic coatings Stainless steel	40
		NBR 70 Low temp.	T	-45 to +80		
Zurcon® Z54** For lubricating hydraulic fluids Very high abrasion resistance Good sealing performance Well suited to abrasive mating surfaces. For swiveling and intermittent low velocity rotary service only Maximum service temperature: +110 °C Cast polyurethane Color: Turquoise	Z54	NBR 70	N	-30 to +100	Steel Hardend steel Chrome-plated steel (shaft) Ceramic coatings Stainless steel	25
		NBR 70 Low temp.	T	-45 to +80		
Zurcon® Z80 For lubricating and non-lubricating fluids and gases High abrasion and extrusion resistance Well suited to abrasive mating surfaces and fluids For swiveling and intermittent low velocity rotary service only Good chemical resistance Ultra-high molecular weight polyethylene Color: White to off-white	Z80	NBR 70	N	-30 to +80	Steel Hardend steel Ceramic coatings HVOF Tungsten carbide	30
		NBR 70 Low temp.	T	-45 to +80		

* Service temperatures are only valid when using hydraulic mineral oil. Note that frictional heat may cause increased temperatures at the seal.

** Maximum diameter 2,200 mm

☐ Recommended material.

Note:

Rotary seals exert high loads on mating surfaces and mild steels are best suited for slow or swivelling service.

As a basic principle, the hardness of the mating surface should increase with the peripheral speed, and a hardness of 60 HRC is recommended for velocities above 1 m/s. Due to the mechanical stresses imposed, a hardness depth of 0.5 mm or more is recommended to limit dimensional changes to the mating

■ Installation Recommendation for Shaft

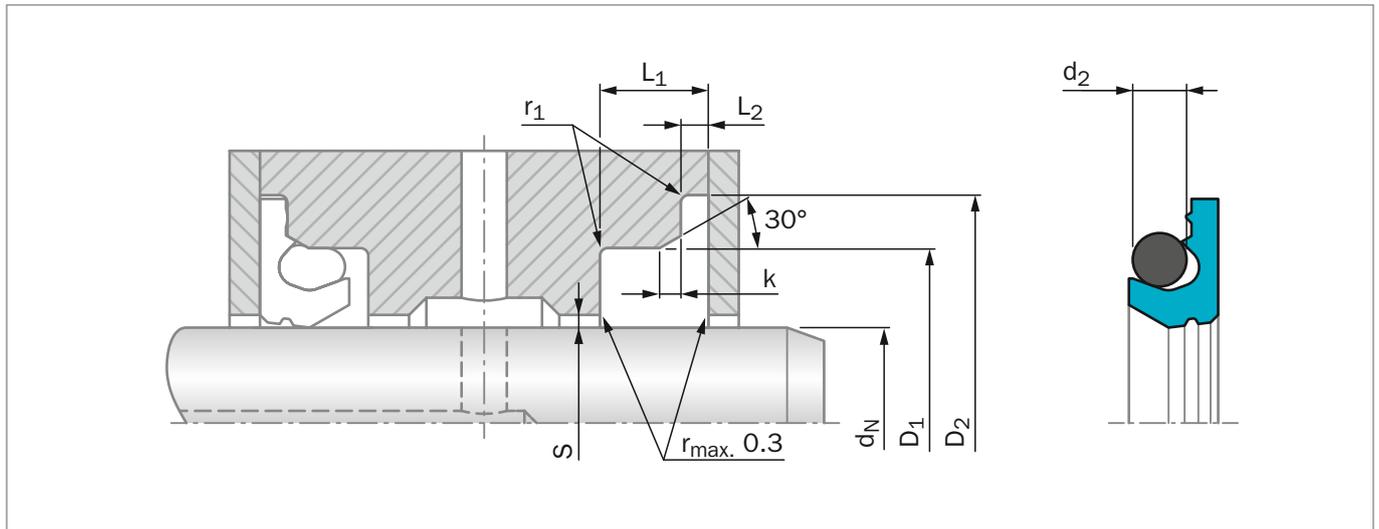

Figure 152: Installation Drawing

Table 106: Installation Dimensions – Standard Recommendations

Series Number	Shaft Diameter		Groove Diameter		Groove Width		Lead-in Chamfer	Ra-dius	Radial Clearance S_{max}^*			O-Ring Cross-Section-Ø		
	d_N f8/h9		D_1 H9	D_2 H10	L_1 min	L_2			k	r_1	10 MPa		20 MPa	30 MPa
	Recommended Range	Available Range												
TE310	10 - 19.9	6 - 100.0	$d_N + 5.0$	$d_N + 9.0$	3.6	0.85 +0/-0.10	0.8	0.3	0.20	0.15	-	1.78

Turcon[®] Roto VL Seal[®]

■ Turcon® Roto VL Seal®

■ Description

Turcon® Roto VL Seal® is a single-acting rotary seal with the same groove dimensions as standard O-Rings (see Figure 154).

The design is optimised for friction, leakage and service life.

Turcon® Roto VL Seal® offer improved performance in terms of high dynamic seal efficiency, low friction and static sealing by an elastomer component.

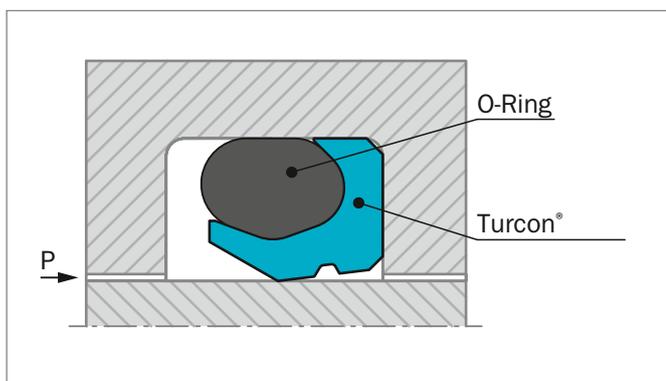

Figure 154: Turcon® Roto VL Seal®

Turcon® Roto VL Seal® covers both shaft and bore installations.

The single-acting Roto VL Seal® is a combination of a Turcon® based slipper seal and an energizing O-Ring. It has an interference fit which together with the squeeze of the O-Ring ensures a good sealing effect even at low pressure. At higher system pressures, the O-Ring is energized by the fluid pushing Roto VL Seal® against the sealing face with increased force.

Roto VL Seal® has very high static sealing ability provided by the O-Ring, which is protected from damage under pressure cycles by the supporting concave seal back and keeps it in position also at high working pressure.

ADVANTAGES

- Standard O-Ring groove dimensions, ISO 6194 and AS 4716
- For rotary, turning and helical movements
- Low to high pressure
- Low friction
- Stick-slip-free starting, no sticking

- High static sealing effect
- High dimensional stability
- Lubricant reservoir
- Available in Turcon® and Zurcon® materials
- Available in most materials and in all sizes up to 2,600 mm for shaft seals and to 2,700 mm for bore seals

APPLICATIONS EXAMPLES

The seal is used in hydraulics and general machine construction as an alternative to other single-acting seals according to their individual advantages in:

- Rolling Mills: Bearing Grease Seals
- Tool Machine Industry, mainly Machining Centres
- Hydraulic Swivels
- Injection Molding Machines: Rotary Injection Unit
- Valve Spindles
- Food Processing: Blender and Mixers
- Hydraulic Steering Units
- Hydraulic Rotator: Forest machines
- Rotator for Handling Devices
- Vane Actuators / Motors
- Hydraulic Motors
- Hydraulic Pumps
- Propeller Thrusters
- ROV (Remotely Operated Vehicle)

OPERATING CONDITIONS

Seal performance is influenced by such factors as lubrication capability of the sealed medium and heat dissipation in the hardware. Therefore testing should always be carried out. With good lubrication, the following values can be used:

Movement:	Rotary and oscillating or helical
Pressure:	Up to 30 MPa at slow turning motion 20 MPa recommended max. at continuous rotation
Speed:	Up to 2 m/s and/or 1,000 rpm according to seal material

Temperature:	Turcon® materials: -40 to +120 °C *) (+150 °C at slow turning) according to O-Ring material
	Zurcon® Z54: -40 to +80 °C *) (+100 °C at slow turning) according to O-Ring material
	Zurcon® Z80: -40 to +60 °C *) (+80 °C at slow turning) according to O-Ring material
Media:	Mineral oil-based hydraulic fluids, flame-retardant hydraulic fluids, environmentally friendly hydraulic fluids (bio-oils), water and others, depending on seal and elastomer material.
Availability:	Shaft diameters from 6 to 2,600 mm (2,200 for Zurcon® Z54) Bore diameters from 10 to 2,700 mm (2,300 for Zurcon® Z54)
Caution with:	Operating at temperatures above +80 °C, use O-Rings in HNBR or FKM Rotary service on shafts and bores with poor heat dissipation Shaft and bores with hardness below 50 HRC Constant rotation for Zurcon® materials

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure, temperature and gap value.

***) IMPORTANT NOTE FOR BORE VERSION:**

In the case on unpressurized applications in temperatures below 0 °C please contact your local Trelleborg Sealing Solutions marketing company for more information.

RADIAL NOTCH

Turcon® Roto VL Seal® can be delivered with radial notches on the “back side” (low pressure side). This is an advantage if the seal is used in rotary applications. If pressurized fluid is trapped between the seal and groove corner, notches can prevent the seal from rotating in the groove. (See ordering examples).

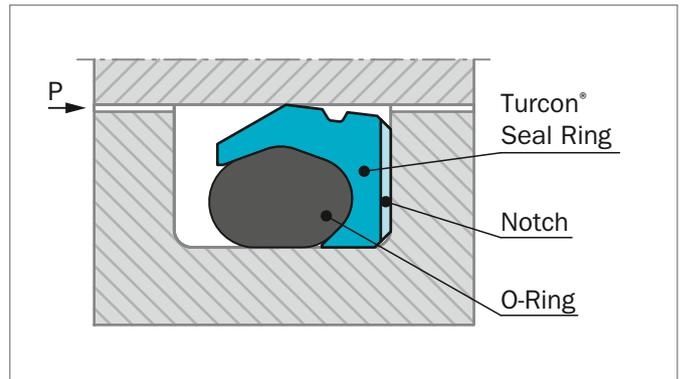

Figure 155: Turcon® Roto VL Seal® with radial notch

FRICIONAL POWER

Guide values for the frictional power (P) can be determined from the graph in Figure 156. They are shown as a function of the sliding speed and operating pressure for a shaft diameter of 50 mm with an oil temperature of +60 °C. At higher temperatures, these application limits must be reduced.

Formula for other diameters d:

$$P = \frac{P_{50} \times (d) \text{ [W]}}{(50 \text{ mm})}$$

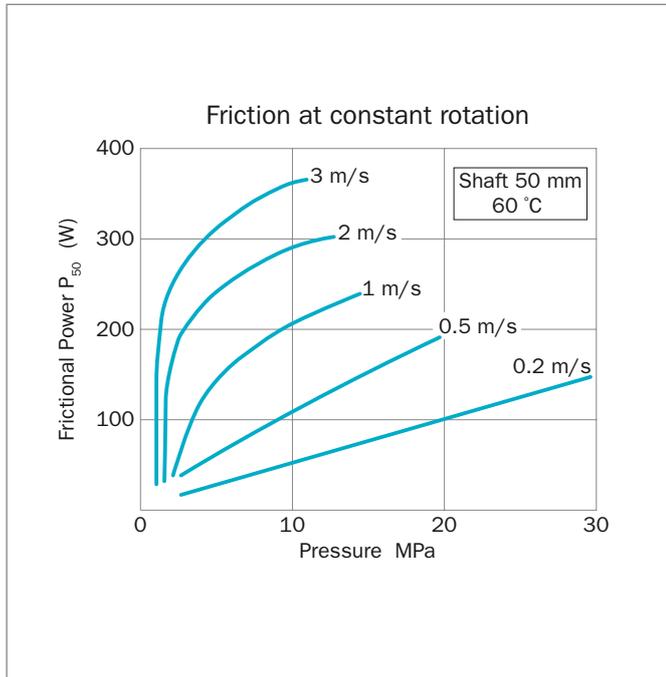

Figure 156: Frictional power for Turcon® Roto VL Seal®

The guide values apply for constant operating conditions. Pressure fluctuations or alternating directions of shaft rotation can result in considerably higher friction values.

INSTALLATION INSTRUCTIONS

Roto VL Seal® is installed according to information at page 313.

Closed groove installation according to dimensions at Table 111 on page 306.

O-RING SIZE

O-Rings for Roto VL Seal® are selected to suit the groove diameter.

For shaft seals the O-Ring should have OD equal to or smaller than groove diameter, for bore seals the O-Ring should have ID equal to or smaller than groove diameter.

RECOMMENDED MATERIALS

The following material combinations have proven effective for rotary applications:

Turcon Roto VL Seal® in Turcon® T40

All-round material choice in oil hydraulics, water and other fluids with limited lubrication:

O-Ring:	NBR 70 Shore A	N
	FKM 70 Shore A	V
	HNBR 70 Shore A	H

Set code: T40N, T40V or T40H

Turcon Roto VL Seal® in Turcon® in M15

Material with high sealing effect for light to medium applications in fluids with good lubrication:

O-Ring:	NBR 70 Shore A	N
	FKM 70 Shore A	V
	HNBR 70 Shore A	H

Set code: M15N, M15V or M15H

Turcon Roto VL Seal® in Zurcon® in Z80

For slow turning applications fluid, with air, gases and/or risk of high abrasive wear.

Temperature limit -45 °C to +80 °C:

O-Ring:	NBR 70 Shore A	N
	FKM 70 Shore A	V
	(according to media)	

Set code: Z80N or Z80V

Z80 is not for constant rotation.

For specific applications other Turcon® and Zurcon® materials are available.

Table 110: Turcon® Roto VL-Seal®

Material, Applications, Properties	Code	O-Ring Material Shore D	Code	Service Temp.* °C	Mating Surface Material	MPa max. Dynamic
Turcon® M04 For lubricating and non-lubricating fluids and gases Smooth and tight surface texture Good sealing performance Suitable for softer mating surfaces High extrusion resistance For swiveling and low velocity rotary service only Carbon filled Color: Black	M04	NBR 70	N	-30 to +100	Steel	30
		NBR 70 Low temp.	T	-45 to +80	Hardened steel	
		FKM 70	V	-10 to +200		
		HNBR 70	H	-30 to +150		
Turcon® M15 Recommended material for rotary motion For lubricating fluids Tight surface texture Good sealing performance Very good wear properties Low friction Good extrusion resistance Suited to softer mating surfaces Polyaramide, mineral fiber, lubricant, graphite and Turcon® filled Color: Dark gray	M15	NBR 70	N	-30 to +100	Hardened steel	30
		NBR 70 Low temp.	T	-45 to +80		
		FKM 70	V	-10 to +200		
		HNBR 70	H	-30 to +150		
Turcon® M30 For lubricating and non-lubricating fluids and gases Good wear and extrusion resistance Suited to high temperature service Tight surface structure Good sealing performance Suited to softer surfaces For swiveling and low velocity rotary service only Aromatic polymer, graphite, Turcon® filled Color: Dark green-gray.	M30	NBR 70	N	-30 to +100	Steel	30
		NBR 70 Low temp.	T	-45 to +80	Hardened steel Stainless steel	
		FKM 70	V	-10 to +200	Titanium	
		HNBR 70	H	-30 to +150	HVOF Tungsten carbide	
Turcon® T40 All-round material for rotary and turning movements. For lubricating and non-lubricating fluids. Good wear resistance and service life also with non-lubricating fluids. Surface texture less suited for gas sealing. Carbon fiber filled Color: Grey.	T40	NBR 70	N	-30 to +100	Hardened steel	30
		NBR 70 Low temp.	T	-45 to +80	Hard Alloys	
		FKM 70	V	-10 to +200		
		HNBR 70	H	-30 to +150		

Table is continued on next page

Material, Applications, Properties	Code	O-Ring Material Shore D	Code	Service Temp.* °C	Mating Surface Material	MPa max. Dynamic
Zurcon® Z53** For lubricating hydraulic fluids Very high abrasion and extrusion resistance Good sealing performance Well suited to abrasive mating surfaces For swiveling and intermittent low-velocity rotary service only Limited chemical resistance Maximum service temperature: +110 °C Cast polyurethane Color: Yellow to light brown	Z53	NBR 70	N	-30 to +100	Hardened steel Chrome-plated steel (shaft) Ceramic coatings Stainless steel	40
		NBR 70 Low temp.	T	-45 to +80		
Zurcon® Z54** For lubricating hydraulic fluids Very high abrasion resistance Good sealing performance Well suited to abrasive mating surfaces. For swiveling and intermittent low-velocity rotary service only Maximum service temperature: +110 °C Cast polyurethane Color: Turquoise	Z54	NBR 70	N	-30 to +100	Steel Hardened steel Chrome-plated steel (shaft) Ceramic coatings Stainless steel	25
		NBR 70 Low temp.	T	-45 to +80		
Zurcon® Z80 For lubricating and non-lubricating fluids and gases High abrasion and extrusion resistance Well suited to abrasive mating surfaces and fluids For swiveling and intermittent low-velocity rotary service only Good chemical resistance Ultra-high molecular weight polyethylene Color: White to off-white	Z80	NBR 70	N	-30 to +80	Steel Hardened steel Ceramic coatings HVOF Tungsten carbide	30
		NBR 70 Low temp.	T	-45 to +80		

* Service temperatures are only valid when using hydraulic mineral oil. Note that frictional heat may cause increased temperatures at the seal.

** Maximum diameter 2,200 mm

☐ Recommended material.

Note:

Rotary seals exert high loads on mating surfaces and mild steels are best suited for slow or swivelling service.

As a basic principle, the hardness of the mating surface should increase with the peripheral speed, and a hardness of 60 HRC is recommended for velocities above 1 m/s. Due to the mechanical stresses imposed, a hardness depth of 0.5 mm or more is recommended to limit dimensional changes to the mating

■ Installation Recommendation for Shaft

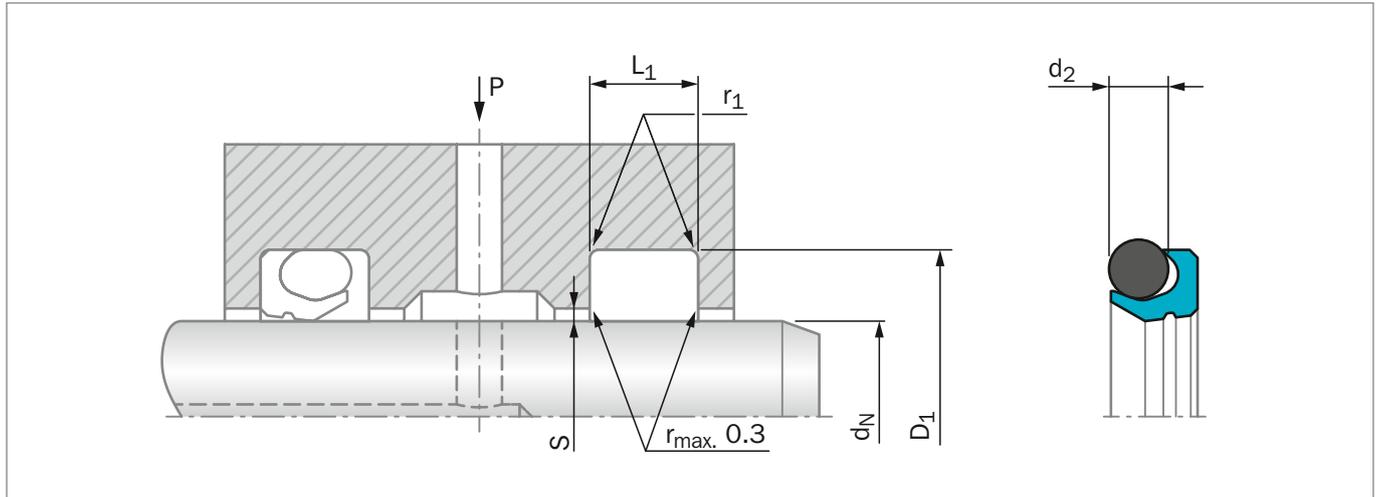

Figure 157: Installation Drawing

Table 111: Installation Dimensions – Standard Recommendations

Series Number	Shaft Diameter d_N f8/h9		Groove Diameter D_1 H9	Groove Width $L_1 + 0.2$	Radius r_1	Radial Clearance S_{max}^*			O-Ring Cross-Section- ϕ d_2	No. of grooves in the Sealing Surface
	Recommended Range	Available Range				10 MPa	20 MPa	30 MPa		
TE110	10 - 19.9	6 - 100.0	$d_N + 4.5$	3.6	0.4	0.20	0.15	-	1.78	0
TE120	20 - 39.9	10 - 200.0	$d_N + 6.2$	4.8	0.6	0.25	0.20	0.15	2.62	1
TE130	40 - 119.9	20 - 400.0	$d_N + 9.4$	7.1	0.8	0.30	0.25	0.20	3.53	1
TE140	120 - 399.9	35 - 650.0	$d_N + 12.2$	9.5	0.8	0.35	0.30	0.25	5.33	2
TE150	400 - 649.9	125 - 999.9	$d_N + 15.9$	12.2	0.8	0.40	0.35	0.30	7.00	2
TE160	650 - 999.9	400 - 999.9	$d_N + 19.0$	15.0	0.8	0.45	0.40	0.35	8.40	2
TE16X	1,000 - 2,600	-	$d_N + 19.0$	15.0	0.8	0.45	0.40	0.35	8.40	2

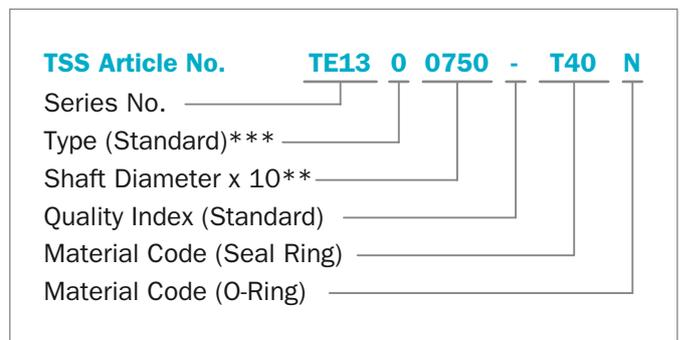

* At pressures > 30 MPa: Use diameter tolerance H8/f8 (bore / shaft) in area of seal.

ORDERING EXAMPLE

Roto VL Seal® complete with O-Ring, standard application:

Series: TE130 (from Table 111)
Shaft diameter: $d_N = 75.0$ mm
TSS Part No.: TE1300750 (from Table 112)

Select the material from Table 110. The corresponding code numbers are appended to the TSS Part No. Together they form the TSS Article No. The TSS Article No. for all intermediate sizes not shown in Table 112 can be determined following the example opposite.

** For diameters $\geq 1,000.0$ mm multiply only by factor 1.
 Example: TE16X for diameter 1,200.0 mm
 TSS Article No.: TE16X1200-T40N

*** Use suffix "N" for seals with radial notches, for diameter $d_N < 1,000$ mm (Figure 155).
 (Radial notches for diameter $d_N \geq 1,000$ mm TSS Special Article Number is required).

* At pressures > 30 MPa: Use diameter tolerance H8/f8 (bore / shaft) in area of seal.

ORDERING EXAMPLE

Roto VL Seal® complete with O-Ring, standard application:

Series:	TE240 (from Table 113)
Bore diameter:	$D_N = 250.0$ mm
TSS Part No.:	TE2402500 (from Table 114)

Select the material from Table 110. The corresponding code numbers are appended to the TSS Part No. Together they form the TSS Article No. The TSS Article No. for all intermediate sizes not shown in Table 114 can be determined following the example opposite.

** For diameters $\geq 1,000.0$ mm multiply only by factor 1.
Example: TE26X for diameter $D_N = 1,200.0$ mm
TSS Article No.: TE26X1200-T40N

*** Use suffix "N" for seals with radial notches, for diameter $D_N < 1,000$ mm (Figure 155).
(Radial notches for diameter $D_N \geq 1,000$ mm TSS Special Article Number is required).

Table 114: Standard Installation Dimensions / TSS Part Number

Turcon[®] Roto Seals Installation Instructions

■ Turcon® Roto Seals – Installation Instructions

■ General Description

INSTALLATION INSTRUCTIONS FOR TURCON® ROTO SEALS

The following points should be observed before installation of the seals:

- Check whether the shaft or housing have lead-in chamfers; if not, use an installation mandrel or sleeve.
- Deburr and chamfer or round sharp edges, cover the tips of any screw threads.
- Remove machining residues such as chips, dirt and other foreign particles and carefully clean all parts.
- The seals can be installed more easily if they are greased or oiled. Attention must be paid to the compatibility of the media and seal materials with these lubricants. Use only grease without solid additives (e.g. molybdenum disulfide or zinc sulfide).
- Do not use installation tools with sharp edges.

Turcon® Roto Seals are preferably installed in closed grooves. Depending on type and size installation in split grooves is also possible (see Figure 159, Figure 160 and Figure 161).

Turcon® Roto Variseal® and Turcon® Roto VL Seal® F are always installed in split grooves (see Figure 161).

INSTALLATION IN SPLIT GROOVES

Roto Glyd Ring® types and Roto VL Seal® for Shaft and Bore: Installation in split grooves is simple. The following installation sequence is recommended:

- Pull the O-Ring onto the Turcon® seal ring.
- Press the seal element into the groove. The O-ring must not be allowed to twist.

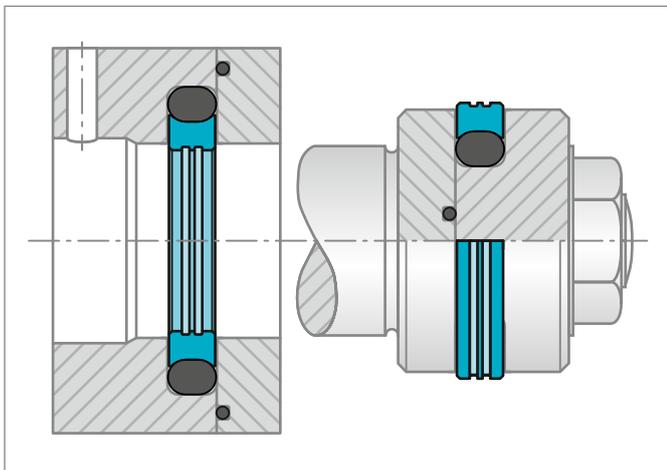

Figure 159: Installation of Roto Glyd Ring® in split groove

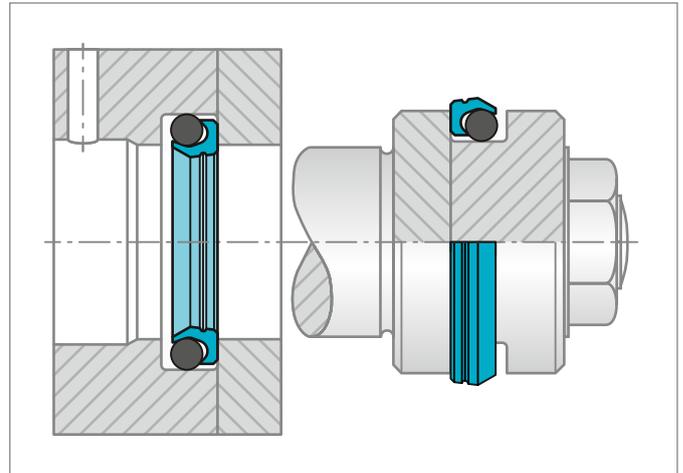

Figure 160: Installation of Roto VL Seal® in split grooves

- Calibrate the seal before the shaft is inserted.

The shaft or housing themselves can be used for this purpose, provided they have the required lead-in chamfers. Alternatively a corresponding sizing mandrel or sleeve must be used.

INSTALLATION OF TURCON® ROTO VARISEAL® AND TURCON® ROTO VL SEAL® F

Roto Variseal® and Roto VL Seal® F are dimensionally interchangeable and always installed in split grooves (see Figure 159 and Figure 161).

Installation should be performed in the following steps in order to ensure a concentric and strain-free fit:

- Pull the O-Ring on the Turcon® seal ring (only for Roto VL Seal® F).
- Place the seal into the open groove.
- Fit the cover loosely onto the housing

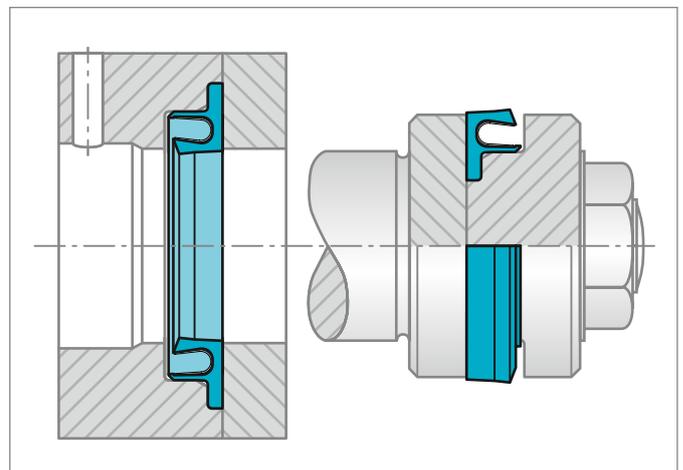

Figure 161: Installation of Variseal®

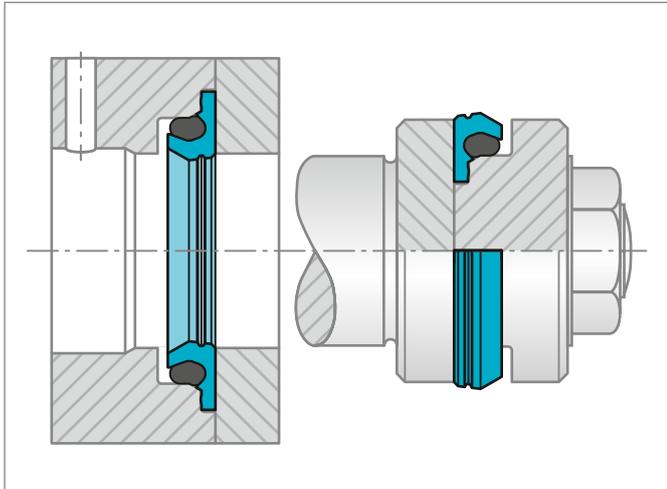

Figure 162: Installation of rod Turcon® Roto Variseal® and Roto VL Seal® F in split groove

- Insert the shaft or housing - check whether shaft or housing have the recommended lead-in chamfers; if not, use an installation mandrel or sleeve.
- Tighten the cover.

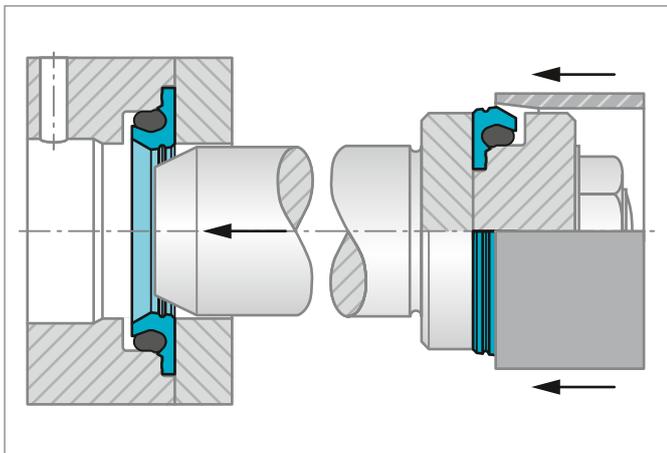

Figure 163: Installation of rod Turcon® Roto Variseal® and Roto VL Seal® F in split groove

INSTALLATION RECOMMENDATION IN CLOSED GROOVES FOR SHAFT SEALS

Installation in closed grooves is possible for diameters according to Table 115, Table 116 and Table 118.

Seal sizes for smaller diameters than stated in the Tables require split groove assembly.

CLOSED GROOVE INSTALLATION LIMITS FOR TURCON® ROTO GLYD RING® TYPE FOR SHAFT

TG72	$d_N \geq 40$
TG73	$d_N \geq 60$
TG74	$d_N \geq 100$
TG75	$d_N \geq 256$

INSTALLATION PROCEDURE FOR TURCON® ROTO GLYD RING® TYPE SHAFT SEALS:

- Place the O-Ring into the groove first (avoid twisting the ring)
- Fold the Turcon® seal ring into a kidney shape (see Figure 164).
- The seal must have no sharp bends. Avoid bending the seal at the position of the notches.
- Place the folded Turcon® seal ring into the groove and push against the O-Ring.

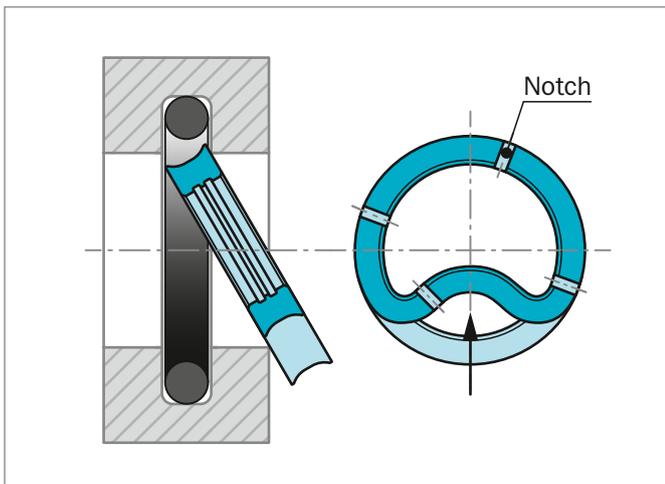

Figure 164: Installation of shaft Roto Glyd Ring® type in closed groove

- Calibrate the seal before the shaft is inserted.

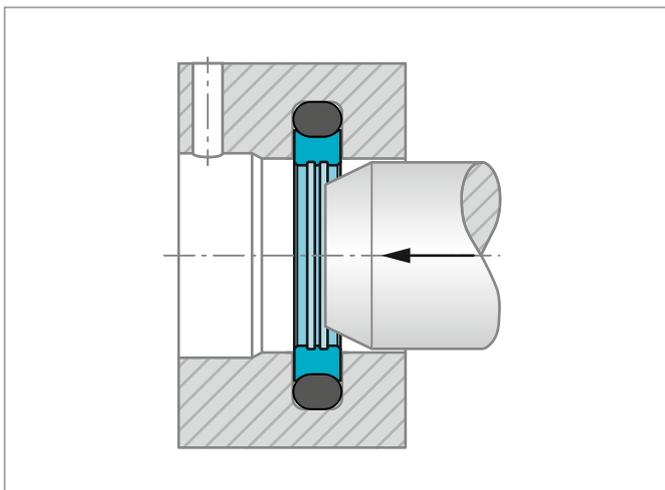

Figure 165: Calibration of installed Roto Glyd Ring®

The shaft itself can be used for sizing, provided that it has the required lead-in chamfer as per recommendations in Table 122.

Otherwise, a corresponding sizing mandrel in polymer material (e.g. POM, polyacetal) must be used.

INSTALLATION OF ROTO GLYD RING® V FOR SHAFT SEALS

As standard, Turcon® Roto Glyd Ring® V is delivered with the Quad-Ring® installed.

If ordered **without** Quad-Ring®, install the Quad-Ring® in the lubrication groove following this procedure:

- 1) To facilitate the assembly, lubricate the Quad-Ring® with the media or a lubricant compatible with the media.
- 2) Insert four small sections of the Quad-Ring® cord into the lubrication groove, as shown at the red arrows on Figure 166. Continue to insert sections in direction of the blue arrows, followed by more sections, until the entire cord is mounted.
- 3) Use a knitting pin with a rounded tip or similar to carefully push the Quad-Ring® cord into the bottom of the lubrication groove – without damaging the sealing lips of the Turcon® ring. Make sure that the Quad-Ring® cord is evenly distributed. For mounting Roto Glyd Ring® V for shaft in closed grooves, apply the following installation procedure:
- 4) The O-Ring is installed in the groove.
- 5) The Turcon® Roto Glyd Ring® V seal ring, with Quad-Ring® installed, is compressed into a kidney-shape and placed in the groove, see Figure 164 and Figure 165.
- 6) Press the seal into the groove, into its original shape.
- 7) Ensure that the Quad-Ring® is in the correct position in the lubrication groove.
- 8) Calibrate the seal, see Figure 165.

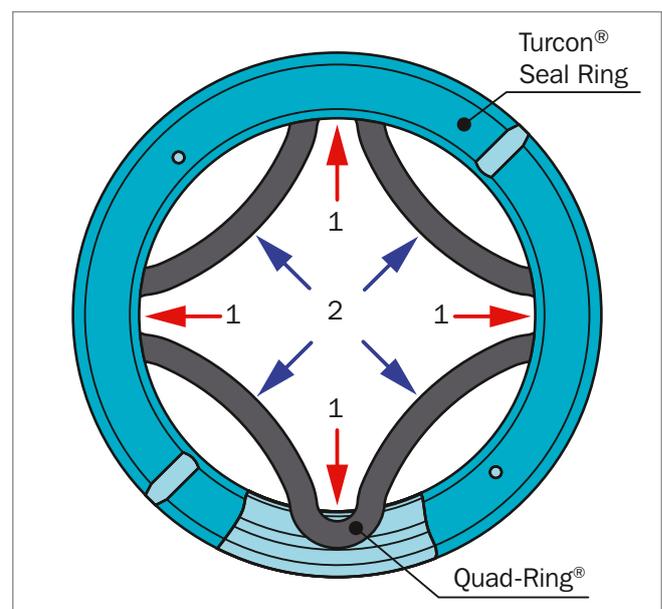

Figure 166: Insert sections of Quad-Ring® diagonally into the lubrication groove

INSTALLATION OF TURCON® ROTO VL SEAL® FOR SHAFT

Table 118: Closed Groove installation Limits

Turcon® Roto VL Seal® for Shafts		
Series No.	Material M12, M15, T40, Z54	Material Z53, Z80
	mm	mm
TE110	$\varnothing d_N \geq 30$	$\varnothing d_N \geq 30$
TE120	$\varnothing d_N \geq 30$	$\varnothing d_N \geq 40$
TE130	$\varnothing d_N \geq 50$	$\varnothing d_N \geq 50$
TE140	$\varnothing d_N \geq 80$	$\varnothing d_N \geq 80$
TE150	$\varnothing d_N \geq 125$	$\varnothing d_N \geq 125$
TE160	$\varnothing d_N \geq 200$	$\varnothing d_N \geq 400$

Before installing Roto VL Seal® for shaft in closed grooves the O-Ring is inserted and positioned at one side of the groove giving space for the concave seal back. The seal ring is folded and inserted in groove (see Figure 167). Then follow the same procedure as for Roto Glyd Ring®.

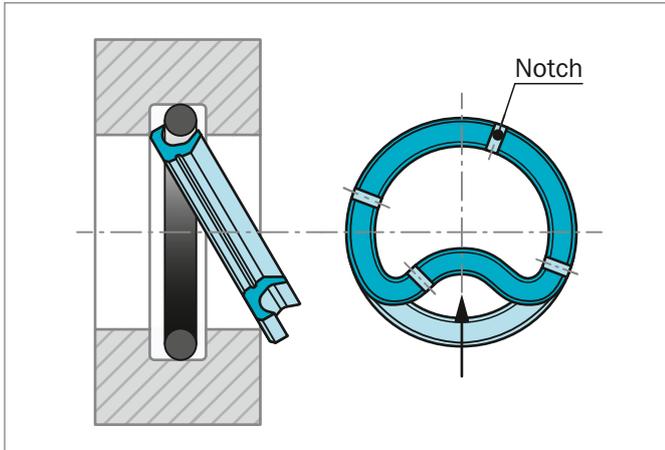

Figure 167: Installation of shaft Turcon® Roto VL Seal® in closed groove

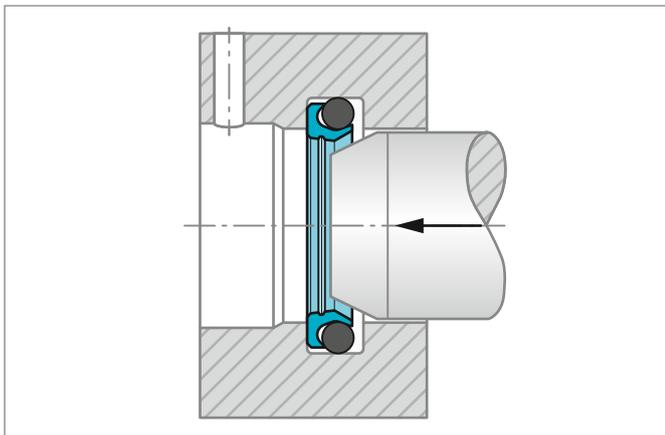

Figure 168: Direction of calibration of installed Roto VL Seal®

INSTALLATION RECOMMENDATION IN CLOSED GROOVES FOR BORE SEALS

Installation in closed grooves is possible for diameters according to Table 119 and Table 121.

Seal sizes for smaller diameters than stated in the Tables require split groove assembly.

CLOSED GROOVE INSTALLATION LIMITS FOR TURCON® ROTO GLYD RING® TYPE BORE SEALS:

Table 119: Closed Groove Installation Limits

Roto Glyd Ring®, Roto Glyd Ring® K, Roto Glyd Ring® S

TG84	$D_N \geq 100$	$D_N \geq 100$	$D_N \geq 130$
TG85	$D_N \geq 400$	$D_N \geq 400$	$D_N \geq 400$

INSTALLATION WITH INSTALLATION TOOL FOR TURCON® ROTO GLYD RING® TYPE BORE SEALS:

Use of a three-piece installation tool is recommended for series production installation of Turcon® seals for Bore (see Figure 169).

The tool consists of:

- Installation Cone
- Expanding Pusher
- Sizing Sleeve

All parts should be made of a polymer material (e.g. POM, polyacetal) with a good surface finish to avoid damage to the seals.

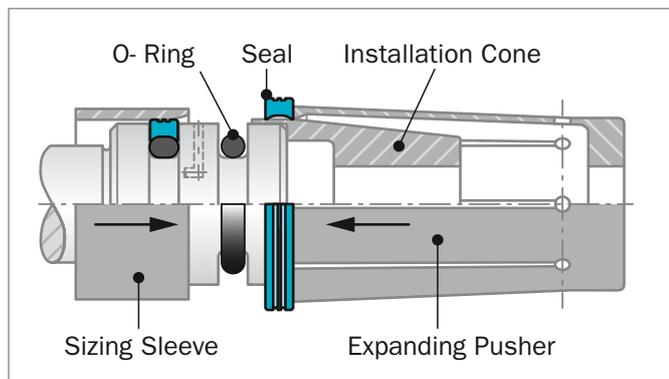

Figure 169: Expanding the Turcon® Roto Glyd Ring® etc. over the Installation Cone using an Expanding Pusher

- Pull the O-Ring over the piston into the groove (take care not to burst the O-Ring).
- Expand the Turcon® Seal Ring over the Installation Cone using the Expanding Pusher by a fast but smooth movement to assure an optimum snap-back of the seal element.
- Calibrate the seal with the Sizing Sleeve before it is installed in the bore.

INSTALLATION WITH INSTALLATION TOOL FOR TURCON® ROTO VL SEAL® FOR BORE:

Table 121: Closed Groove Installation Limits

Series No.	Turcon® Roto VL Seal® for Bore	
	Material M12, M15, T40, Z54	Material Z53, Z80
	mm	mm
TE210	$\varnothing D_N \geq 30$	$\varnothing D_N \geq 50$
TE220	$\varnothing D_N \geq 50$	$\varnothing D_N \geq 75$
TE230	$\varnothing D_N \geq 80$	$\varnothing D_N \geq 110$
TE240	$\varnothing D_N \geq 135$	$\varnothing D_N \geq 150$
TE250	$\varnothing D_N \geq 200$	$\varnothing D_N \geq 200$
TE260	$\varnothing D_N \geq 400$	$\varnothing D_N \geq 400$

Before installing Roto VL Seal® for Bore in closed groove the O-Ring is inserted and positioned at one side of the groove giving space for the concave seal back. Then the seal ring is pushed over an Installation Cone and into the groove - note the difference in design of the Installation Cone depending on direction of installation (see Figure 170).

After insertion in the groove the seal is preferably calibrated with a Sleeve before the piston is inserted in the cylinder Figure 169.

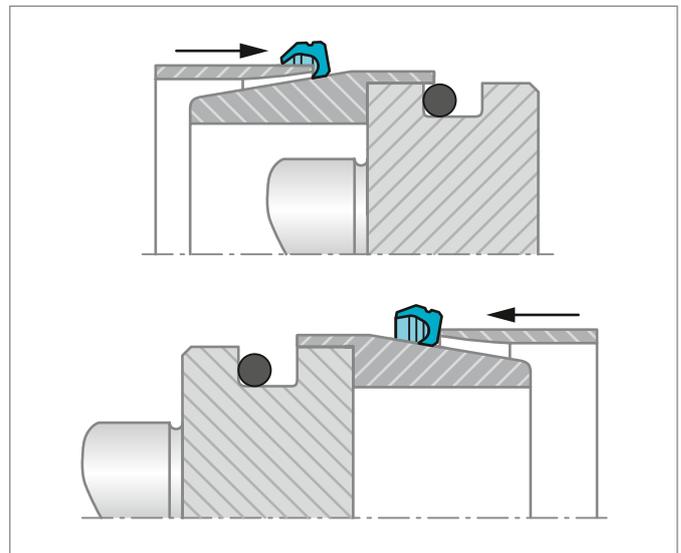

Figure 170: Installation of bore Turcon® Roto VL Seal® in closed groove using an expanding pusher over an installation cone

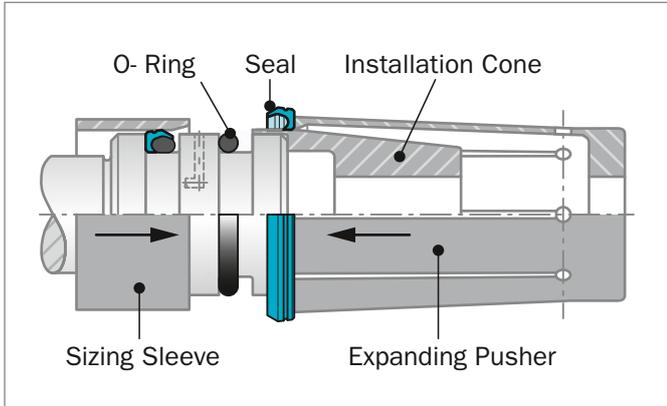

Figure 171: Calibration and installation of bore Turcon® Roto VL Seal® by an Installation Cone and Expanding Pusher

INSTALLATION WITHOUT TOOLS FOR BORE SEALS

If installation has to be performed without installation tools, however, the following points should be observed:

- Turcon® Seal Rings can be installed more easily by heating in oil, water or using a hot air fan to approximately +80 °C to +100 °C (expanding and then sizing).
- First, insert the O-Ring into the piston groove.
- Ensure the O-Ring is not twisted in the groove.
- Fit the Turcon® Seal Ring into the lower groove area.
- Expand the seal ring by using a woven cotton or plastic packing band and allow snapping into the piston groove.
- Centre the seal ring.
- Use no sharp edged tools .

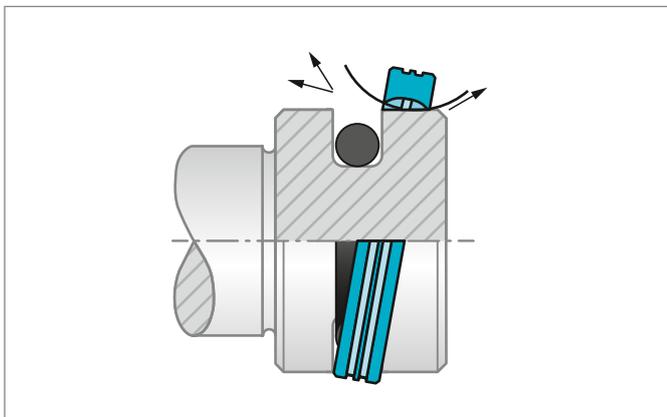

Figure 172: Schematic installation of the Turcon® seal ring

- Calibration of the seal ring can be carried out in the corresponding housing, provided it has the required lead-in chamfer as per Table 122. Otherwise use a calibration sleeve.

LEAD-IN CHAMFER

In order to avoid damage during installation, lead-in chamfers and rounded edges must be provided on the shaft or housing (see Figure 164 and Figure 165). If this is not possible for design reasons, a separate installation tool is recommended.

The minimum length of the lead-in chamfer depends on the profile size of the seal and can be seen from the following tables. If concentricity between the parts is not ensured during installation the lead-in chamfers must be increased correspondingly.

For the surface quality of the lead-in chamfer, the same recommendations apply as given for the sealing surfaces in Table 122.

Table 122: Minimum Lead-in Chamfers for Turcon® Roto Seals

O-Ring Series	Lead-in Chamfers Length C mm	
	15°	20°
000	2.5	2.0
100	3.0	2.5
200	3.5	3.0
300	5.0	4.0
400	6.5	5.0
8.4	7.5	5.5
12.0	10.5	8.0

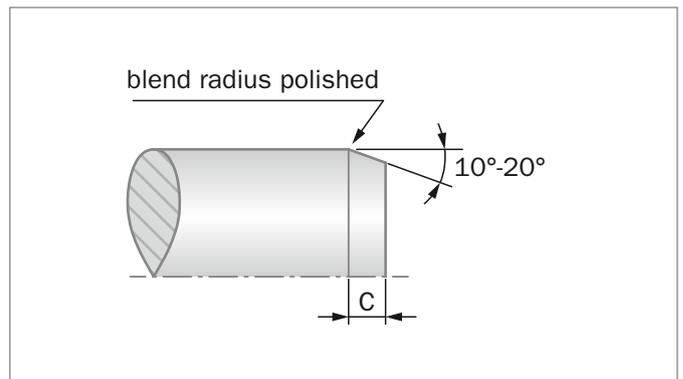

Figure 173: Lead-in chamfer on shaft

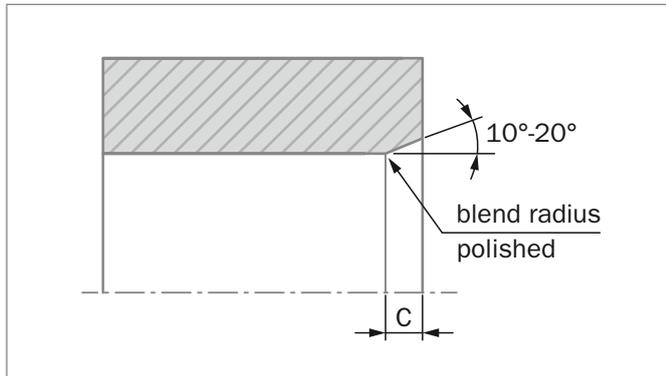

Figure 174: Lead-in chamfer on housing

SURFACE FINISH RECOMMENDATIONS

Shaft and bore surface finish for rotary motion must have no machining leads and be free from scratches, nicks or defects, as well as any contamination. For the rotating surface and the seal groove, plunge grinding is recommended for the finishing process.

Table 123: Surface Finish Recommendations

Parameter	Surface Roughness μm	
	Mating Surface	
	Turcon® and Zurcon® Materials	Groove Surface
Rmax	0.63 – 2.50	< 16.0
Rz	0.40 – 1.60	< 10.0
Ra	0.05 – 0.20	< 1.6

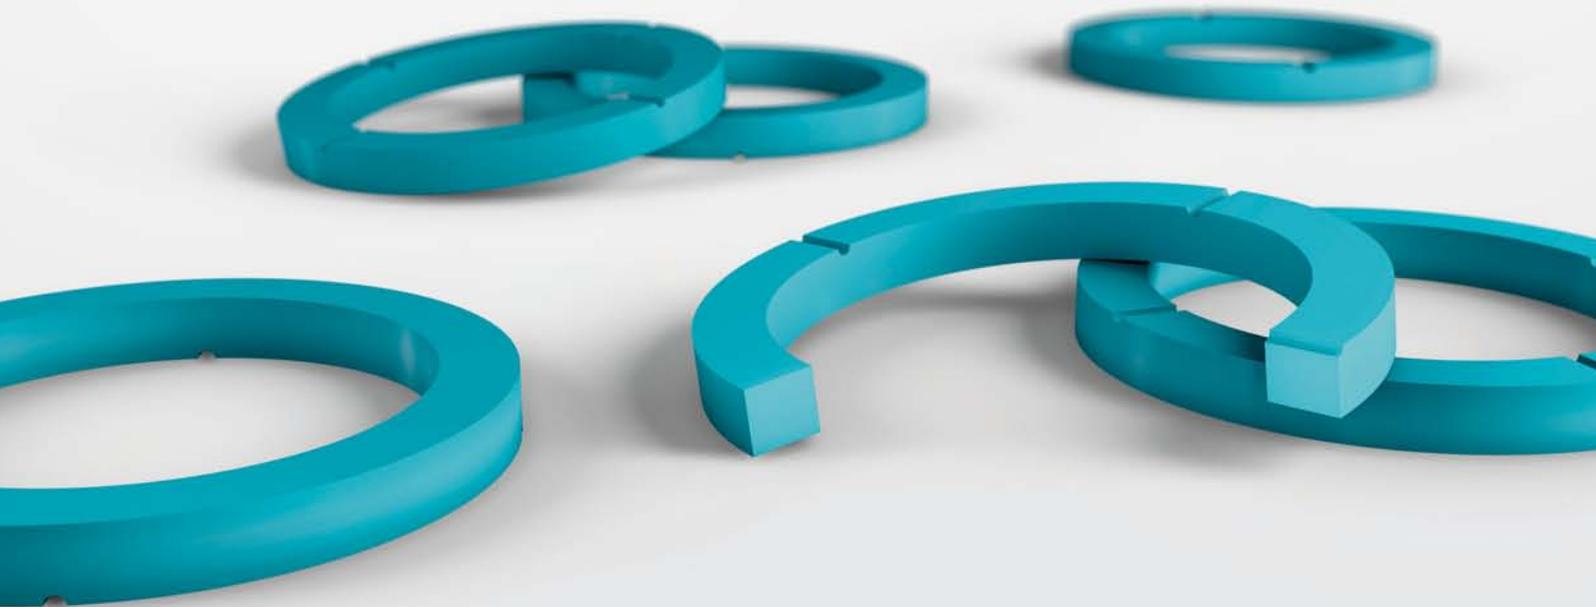

MATING SURFACE MATERIALS

Surface hardness is recommended to be above 55 HRC, hardness depth minimum 0.3 mm. In certain circumstances such as low circumferential velocity, good lubrication and no contamination, surfaces with hardness levels below 55 HRC are suitable.

- Coated surfaces must be finished with particular care.
- Chrome-plating must not peel off in service.
- Good heat dissipation must be assured by the coating.

Turcon® Buffer Ring with Back-pressure Relief

■ Turcon® Buffer Ring with Back-pressure Relief

■ Description

The term “Buffer Ring” has traditionally been used for elements protecting the actual sealing system from damaging high pressure peaks. The Turcon® Buffer Ring is not required to have high sealing effect but it must prevent a pressure trap from forming between the Buffer Ring and the actual seal.

Turcon® Buffer Ring is successfully used as a seal in injection molding machines for the Rotating Injection Unit – a unique utilization of a basic element for helical movements, securing long lifetime.

The Buffer Ring concept is also used in several other situations - alone, as a set of two, or as high pressure protection for other rotary or linear seals by lowering their contribution to friction and seal wear.

METHOD OF OPERATION

Turcon® Buffer Ring is kept in contact with the counter surface by a small interference fit and only activated by differential pressure over the seal. It is further characterized by having notches on one side as relief for backpressure.

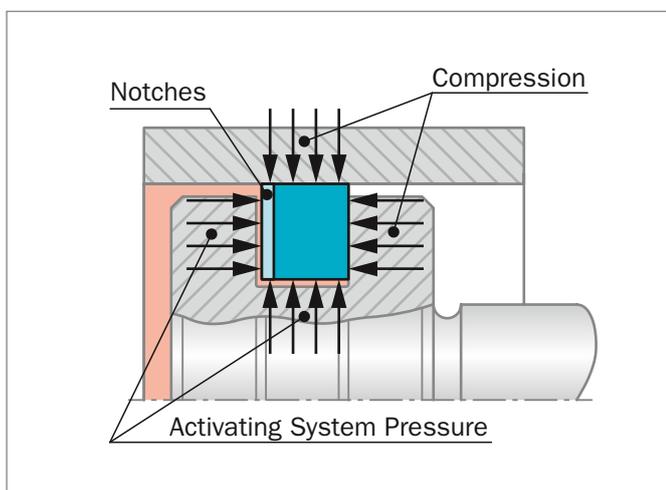

Figure 175: Pressure activation of Turcon® Buffer Ring

The sealing effect is higher and much safer than a Z-cut Piston Ring. Without an O-Ring as activation and static sealing elements, the fluid film is excessive between the Buffer Ring and moving counter surfaces, providing very low friction and wear and resulting in long service life.

The pressure activation takes place in axial and radial outwards directions for bore sealing (radial and inwards for shaft sealing) offering sealing function in a number of applications.

With notches on one side, the Buffer Ring is a single-acting seal ring often used as protector of a common sealing system against peak pressures where the notch prevents risk of pressure trap.

If a double-acting sealing effect is required, it is necessary to install two Buffer Rings back-to-back to take the pressure from both sides (see Figure 175 and Figure 176).

ADVANTAGES

- For rotary, helical and linear motion
- Minimum friction contribution for low energy loss
- Minimum heat generation
- Fully lubricated sealing surfaces
- Low wear ensures long service life
- Protects against pressure peaks
- Increased radial clearance possible
- Prevents pressure trap
- One-piece element
- For lubricating and non lubricating fluids depending on seal material (Turcon®, Zurcon®)

Not recommended for static function because of absence of elastomer activation and static sealing element.

SHAFT SEALING SYSTEM

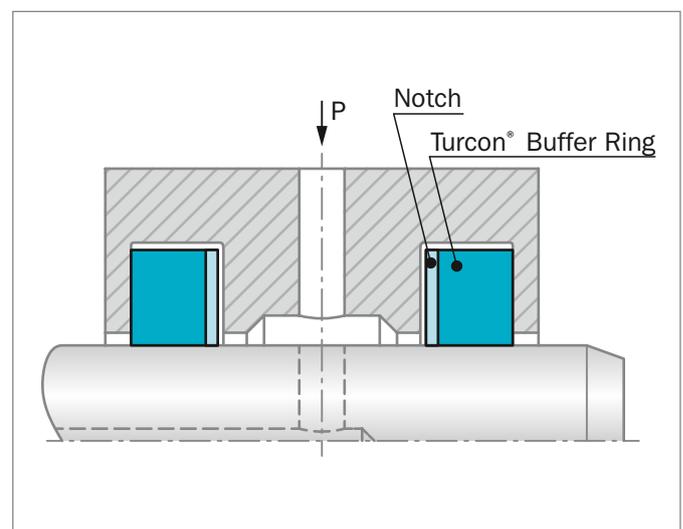

Figure 176: Right installation of Turcon® Buffer Ring

BORE SEALING SYSTEM

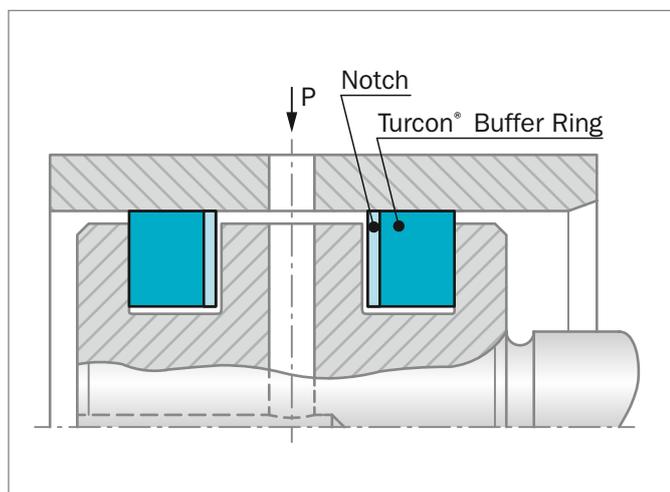

Figure 177: Right installation of Turcon® Buffer Ring

APPLICATIONS

Buffer Rings are typically used:

- Where the requirement of tightness is less than 100%
- Where a wet or fully lubricated seal is required
- Protection of peak pressures in front of sealing systems.
- For very low friction and /or long life sealing systems (with low requirement to tightness)
- Rotating Injection Units in Injection molding machines

OPERATING CONDITIONS

The Turcon® Buffer Ring is recommended for rotary and helical service and reciprocating movements with a length of stroke at least twice the groove width.

Pressure:	Up to 30 MPa as single seal element
Speed:	Up to 15 m/s - linear
pv:	Up to 10 MPa x m/s - rotary
Frequency:	Up to 1 Hz
Temperature:	Piston seals: +5 °C to +160 °C*) Rod seals: -45 °C to +70 °C**)
Media:	Mineral oil-based hydraulic fluids, flame retardant hydraulic fluids, environmentally friendly hydraulic fluids (bio-oils), phosphate ester, water and others, depending on the seal material compatibility.
Clearance:	The maximum permissible radial clearance S_{max} is shown in Table 127 and Table 128 as a function of the operating pressure and functional diameter.

IMPORTANT NOTE

The above data are maximum values and cannot be used at the same time, e.g. the maximum operating speed depends on material type, pressure, temperature and gap value.

Temperature range also depends on media.

*) For bore seals: Buffer Ring is not activated by an elastomer element to compensate for temperature expansion/contraction, and if unpressurized service occurs at temperatures below +5 °C the seal ring will contract and might lose contact with the bore surface.

***) For shaft seals: Buffer Ring is not activated by an elastomer element to compensate for temperature expansion/contraction and if unpressurized service occurs at temperatures above +70 °C the seal ring will expand and might lose contact with the shaft surface.

In general: Before an application with Buffer Ring is qualified for service, functional tests must be performed under all expected working conditions.

INSTALLATION INSTRUCTIONS

Turcon® and Zurcon® materials recommended for Buffer Ring are flexible and installation is done as for Turcon® Roto Glyd Ring® see page 313.

Closed groove installation limits for Buffer Ring see Table 115 and Table 116.

RECOMMENDED MATERIALS

The following material combinations have proven effective for hydraulic applications:

Turcon® Buffer Ring in Turcon® M12

All round material for hydraulic applications with reciprocating, short stroke or helical movements in mineral oils, flame retardant hydraulic fluids HFC, phosphate ester or bio-oils:
Material code: M12

Turcon® Buffer Ring in Turcon® M15

Material with high sealing effect for rotary or oscillating applications in fluids with good lubrication:
Material code: M15

Turcon® Buffer Ring in Turcon® T40

For fluids with low lubricating properties:
Material code: T40

**Table 124: Turcon® and Zurcon® Materials for Buffer Ring**

Material, Applications, Properties	Code	Mating Surface Material	MPa as Single Seal Element
Turcon® M12 For all commonly applied hydraulic fluids including fluids with low lubrication performance Lowest friction and best sliding properties Lowest wear on seals Improved absorption of abrasive contaminants Low wear or abrasion of counter surface Mineral fiber and Additives filled Color: Dark gray	M12	Steel Steel hardened Steel chrome plated (rod) Steel plated (rod) Cast iron Stainless steel Titanium Aluminum (tubes)	30
Turcon® M15 For lubricating fluids Excellent for rotary service High sealing effect Very good wear properties Low friction Polyaramid, mineral fiber, lubricant and graphite filled Color: Dark gray	M15	Steel hardened Steel chrome plated (shaft) Steel plated (shaft) Cast iron	30
Turcon® T40 For linear, rotary and turning movements in fluids with low lubricating properties, e.g. water Surface texture not suitable for gasses Carbon fiber filled Color: Grayite filled Color: Black	T40	Steel Steel hardened Steel chrome plated (shaft) Cast iron Stainless steel Aluminum	30
Zurcon® Z53* For mineral oil based fluids Linear and slowly turning movements Very high abrasion and extrusion resistance For counter surface with rougher surface finish Hard to install Limited chemical resistance Max. working temperature +110 °C Cast polyurethane Color: Yellow to light-brown	Z53	Steel Steel hardened Steel chrome plated (rod) Cast iron Stainless steel Ceramic coating	30

Table is continued on next page

Material, Applications, Properties	Code	Mating Surface Material	MPa as Single Seal Element
<p>Zurcon® Z80*</p> <p>For lubricating fluids and fluids with low lubricating properties, water, air and gases at low pressure.</p> <p>Dry air pneumatics</p> <p>Linear and slowly turning movements</p> <p>Good abrasion and extrusion resistance</p> <p>For service in abrasive conditions and media with particles</p> <p>Good chemical resistance</p> <p>Not for constant rotation</p> <p>Max. working temperature +80 °C</p> <p>UHMWPE (Ultra high molecular weight polyethylene)</p> <p>Color: White to off-white</p>	Z80	Steel Steel hardened Steel chrome plated (rod) Stainless steel Aluminum Ceramic coating	30

* OD max. ø 2,300 mm – ID max. ø 2,200 mm.

Highlighted materials are recommended.

■ Installation Recommendation for Shaft

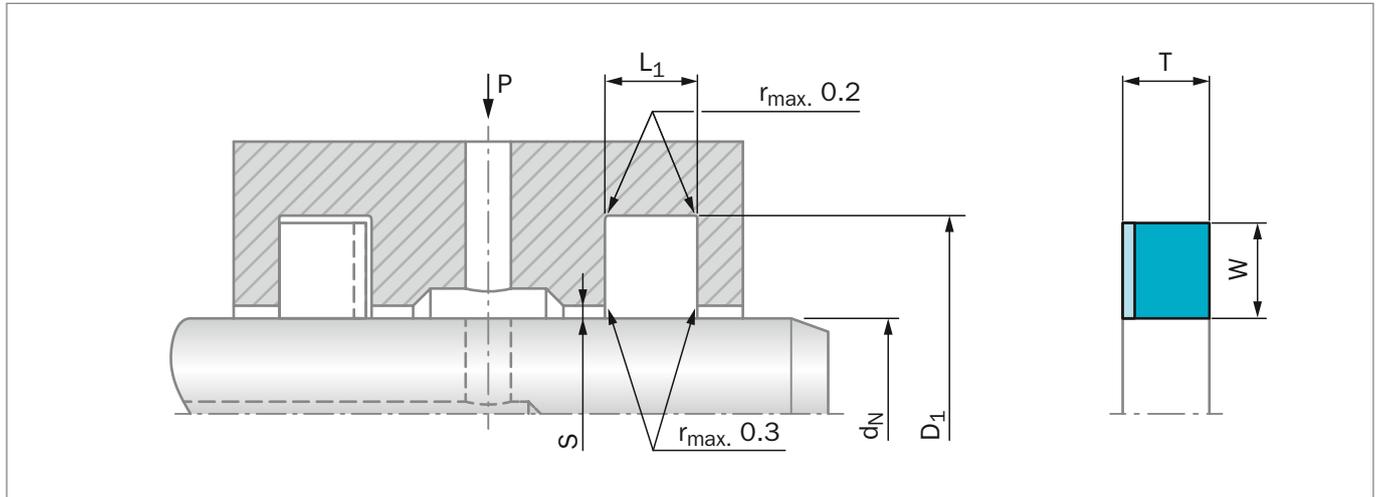

Figure 178: Installation Drawing

RFB8X	1,000.0 - 2,600.0**	-	$d_N + 18.20$	8.00	8.80	7.80	0.50	0.45	0.40	1,000

* At pressures > 30 MPa: Use diameter tolerance H8/f8 (bore/shaft) in area of seal.

Slydring®/Wear-Rings are not applicable at very small clearances; consult the Slydring® catalog.

** Z53 max. \varnothing 2,200 mm

ORDERING EXAMPLE

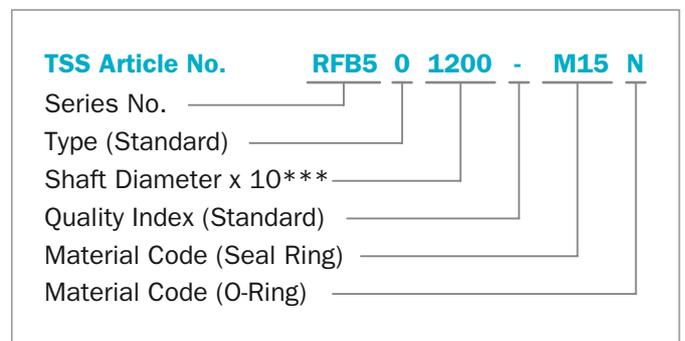

Turcon® Buffer Ring, standard application:

Series: RFB50 (from Table 125)

Shaft diameter: $d_N = 120$ mm

TSS Part No.: RFB501200 (from Table 128)

Select the material from Table 124. The corresponding code numbers are appended to the TSS Part No. Together they form the TSS Article No. The TSS Article No. for all intermediate sizes not shown in Table 128 can be determined following the example opposite. Buffer Ring is available in all sizes. The ring will always be supplied with notches on one side only. Other ring thicknesses and ring widths are available upon request.

*** For diameters $d_N \geq 1,000.0$ mm multiply by 1
 Example: RFB8X for diameter $d_N = 1,500.0$ mm
 Article No. RFB8X1500-M15

Other dimensions and all intermediate sizes up to 2,700 mm diameter including imperial (inch) sizes can be supplied.

Mechanical Face Seals

■ Mechanical Face Seals

■ General Description

Mechanical Face Seals are a special form of mechanical seal. They are also known under other designations, such as lifetime seals, floating seals and heavy-duty seals.

TYPES

There are two different types of Mechanical Face Seal. The most common form is Type DO, which is characterized by the use of an O-Ring as the secondary sealing element (see Figure 180).

Type DF, on the other hand, has an elastomer with a diamond-shaped cross-section-Ø as a secondary sealing element instead of the O-Ring (see Figure 181).

Both types consist of two identical metal seal rings which seal against each other on a lapped seal face.

Special designs, like that in Figure 182, are available on request. Seal types can also be divided by the use of different seal materials.

DESIGN FEATURES

The seals consist of two metallic seal rings. They are mounted in separate housings face-to-face. The elastomeric elements center the seal in the housing.

METHOD OF OPERATION

The elastomeric rings provide three different functions:

- They generate a uniform axial face load. Enough to avoid the open of the seals and not too high to avoid lapped surfaces damage.
- Transmit the torque from rotating half (seat) through the lapped surfaces to the static half.
- They guarantee flexibility to the whole system against vibration and misalignment.
- Prevent the sliding of half group assembled inside its seat.

It is important to note that only one half of the seal rotates; the interface between the two precision lapped mating surfaces rotating against the other at an orthogonal angle to the shaft. They form a leak-proof seal. The seal has a wedge shaped gap from the ID to the seal face allowing for easy

access to lubricate the seal face. Lubrication is necessary at all times. The lubricant builds a thin film between the sliding faces by a capillary effect and centrifugal force.

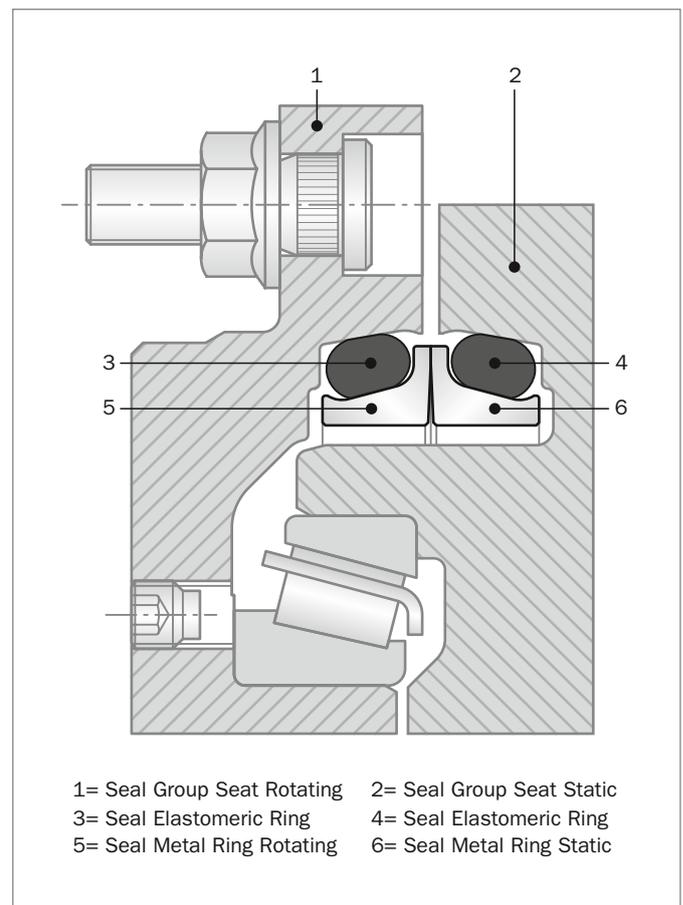

Figure 180: Mechanical Face Seals, Type DO

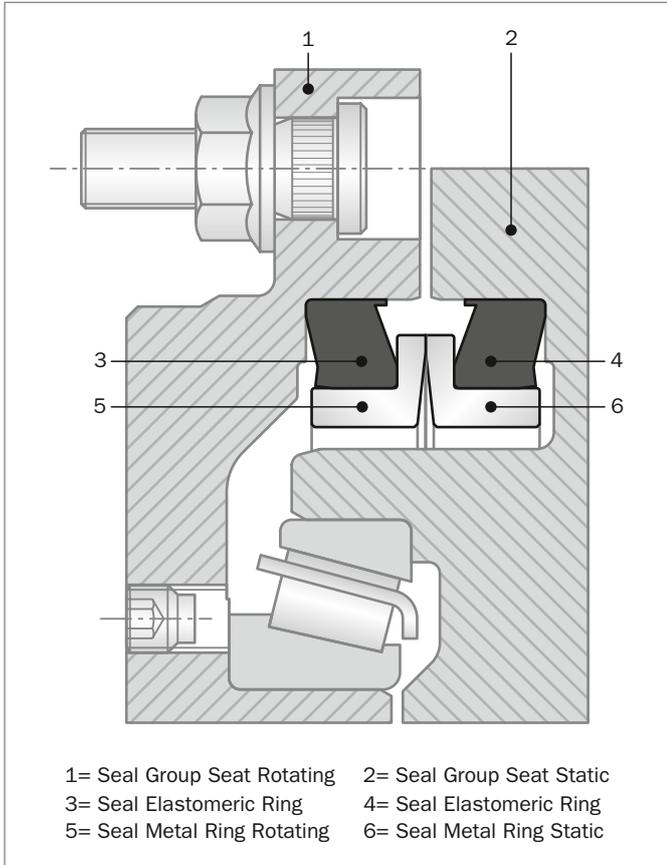

Figure 181: Mechanical Face Seals, Type DF

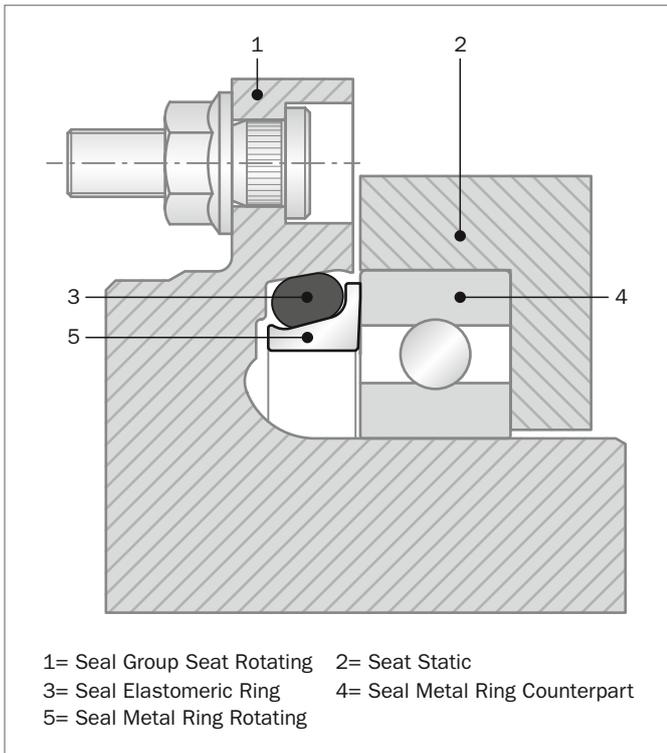

Figure 182: Special Design

ADVANTAGES

- Simple, reliable design
- High sealing effect against dirt, dust, water and abrasive media from the outside and against oil and grease from the inside
- Cost-effective
- Long service life
- Floating, useful against vibration or misalignment
- Maintenance-free
- Easy to assemble

Applications

Mechanical Face Seals are predominantly used to protect rotating elements/devices from external/internal heavily contaminated environment, with a mixture of wear (abrasion), chemical compatibility (corrosion), pressure (from outside to inside or vice versa).

These include:

Market segments as:

- Agriculture
- Mining
- Construction
- Industrial
- Military Equipment

Applications such as:

- Gearboxes
- Axles
- Undercarriages
- Tunnel Boring Machines
- Conveyor Systems
- Mixers
- Stirrers
- Conveyor systems

and other applications with similar conditions or where maintenance-free lifetime sealing is expected.

OPERATING CONDITIONS

The seals should not be subjected simultaneously to maximum pressure and maximum speed.

Operating Pressure:

The shaft seal is pressure-free under normal operating conditions.

The Mechanical Face Seal is suitable to hold up to 0.15 MPa of differential pressure from outside to inside and from inside to outside. For higher differential pressures, please contact your local Trelleborg Sealing Solutions marketing company, which will analyze suitability for the application.

SPEED

Standard:

Cast Iron: 3 m/sec with oil lubrication
100Cr6: 1 m/sec with oil lubrication

Customized*:

Cast Iron: up to 6 m/sec with oil lubrication
(up to 1.5 m/sec with grease lubricant)
100Cr6: up to 2.5 m/sec with oil lubrication
(up to 1 m/sec with grease lubricant)

* For customized solutions with higher peripheral speeds, please contact your local Trelleborg Sealing Solutions marketing company to analyze suitability.

Whether you require a standard or a customized solution, we strongly recommend getting in touch with Trelleborg:

- Whenever you design a new application.
- When an existing application needs to be modified, due to changes in peripheral speed, temperature, pressure, lubrication, or dimension, for example.

RUN IN

It's strongly suggested during the first 10 hours of rotation to work with peripheral speeds not exceeding 1 m/sec.

TEMPERATURE

-50 °C to +180 °C (-58 °F to +356 °F), depending on the elastomeric ring material.

LUBRICATION, MEDIA

The lubrication serves two important functions, and it is needed in all cases. It reduces the friction between the seal face and the mating faces and acts as a cooling agent for the complete shaft and housing.

The best results with regard to wear and service life are achieved with oil lubrication. Grease lubrication is possible but needs special attention, mainly relating to peripheral speed. It's necessary to have a minimum oil level of 1/3 of the seal inside diameter and a full level for grease. Please contact your local Trelleborg Sealing Solutions marketing company in other cases or if environmentally compatible bio-oils have to be used.

Materials

METAL PARTS

Metal parts of Mechanical Face Seals are available in three different alloy compounds (See Table 129).

The hardness of the three different materials on the sliding contact area are:

- Bearing Steel (100Cr6) = 63 +/- 3 HRC
- Ni Hard alloy = 60 +/- 4 HRC
- Chromium based Alloy = 66 +/- 3 HRC

Contact your local Trelleborg Sealing Solutions marketing company to identify suitable material for your application.

Table 129: Alloy Composition

Material Chemical Composition %	Bearing Steel Material 100Cr6	Ni Hard Alloy Material	Chromium Base Alloy Material
C	0.95 - 1.10	2.3 - 3.8	3.4 - 3.8
Cr	1.4 - 1.6	1.2 - 2.0	15.00 - 19.00
Ni	-	2.0 - 5.0	-
Fe	Balance	Balance	Balance

The analysis range serves to take account of the cross section. Deviations can be tolerated as far as the microstructure and the mechanical properties are not affected.

ELASTOMERIC RING

The elastomeric rings for Mechanical Face Seal are available in different compounds, as in Table 130.

Table 130: Elastomeric Ring Compound

Type	Temperature Range (min / max) °C		Hardness Available SH A: +/-5			Mechanical Resistance	Oil Suitability
NBR	-25	+100	50	to	70	Good	Good
NBR LT	-50	+100	60	to	70	Good	Good
HNBR	-30	+150	60	to	65	Very Good	Good
HNBR LT	-40	+150			65	Very Good	Good
FKM	-15	+200			65	Good	Good
VMQY	-50	+175			65	Quite Good	No EP

Elastomeric rings are available in different compounds. General different compounds can cover the mentioned temperature and hardness ranges. Please contact your local Trelleborg Sealing Solutions marketing company for more information and to analyze the best elastomeric ring compound suitable for use with the final application.

■ Design Instructions

SEAL HOUSING

The installation dimensions of the seal housing are shown in Table 131.

The axial gap (S) in the housing is such that it meets the demands of the construction machinery industry.

For higher peripheral speeds, please contact your local Trelleborg Sealing Solutions marketing company.

It's necessary to avoid any burrs or cutting edges in the seats.

For the surface of the seal installation chamber, we recommend a machining quality of:

$$3.0 \mu < Ra < 6.0 \mu m$$

$$12.5 < Rz < 25$$

SHAFT

The Mechanical Face Seal does not contact the shaft. For this reason, no particular demands have to be met on the hardness or surface finish.

To ensure correct operation, a minimum gap must be maintained between the shaft and the inside diameter. This gap serves to supply the seal with lubricant.

■ Storage Conditions

The parts have to be stored according to several conditions:

- The single carton box and the inner packaging has to be intact without any opening until assembly.

Parts must be:

- stored in a dry environment with temperature between 0 °C and +30 °C
- stocked far from sources of heat
- kept away from contact with light sources.

If the above conditions are respected, the Mechanical Face Seal are protected for approximately 1 year from the shipping date.

■ Installation Instructions

To receive detailed and up-to-date video guides and documentation related to assembly and installation, scan the QR code with a mobile device or visit www.tss.trelleborg.com/mfs

The short description of assembly procedure both for DO type and DF type follows.

PREPARATION FOR INSTALLATION

Mechanical Face Seals must be handled carefully, avoiding damage to the lapped surfaces. The installation area must be kept free from dust and dirt.

The installation should be carried out in the following steps.

PREPARATION BEFORE INSTALLATION

- Remove the seal from its packing only just before installation.
- Do not stand the seal on the lapped surface.
- The housing must be free of notches or burrs on installation radii and free from any residues of previous working operations e.g. dirt, grease, metal chips, etc.

INSTALLATION INSTRUCTIONS FOR THE TYPE DO

- Make sure that the O-Ring is not twisted. A twisted O-Ring may cause a looped effect.
- Check if O-Ring is properly placed back on the seal. The O-Ring must be seated in the outer radius inside the retaining lip.
- Clean the half seal groups in a volatile solvent or industrial denaturated alcohol and wait for it to evaporate, being sure that no oil film remains on the parts.
- Assemble each half seal into the house using an installation tool (Figure 183). Use a uniform load over the tool to push the half group in to the house until the elastomeric ring reaches the related housing border. The Installation Tool has to only touch the O-Ring and not the metal ring and importantly not the lapped surface. If you have any doubts or require assistance, please contact your local Trelleborg Sealing Solutions marketing company.
- When the tool touches the house all around the circumference, the installation phase is complete.

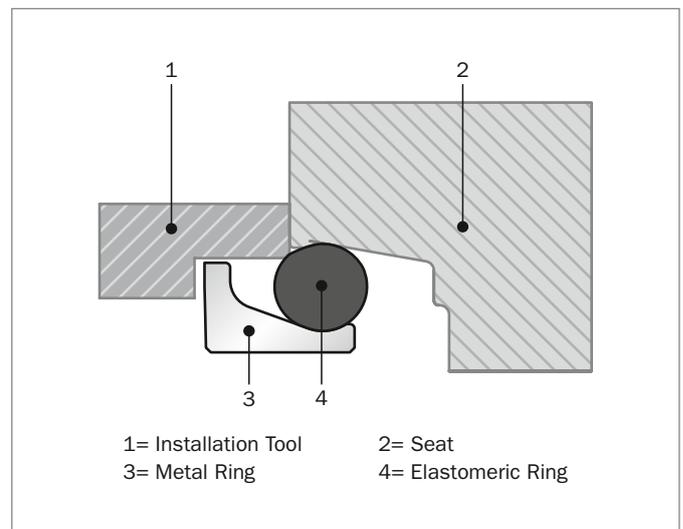

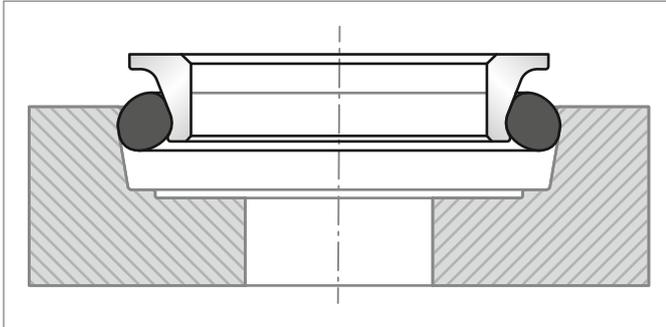

Figure 183: Installation Tool for DO Type

- Remove the tool and visually check the position of the O-Ring and seal. Make sure that everything is seated symmetrically.

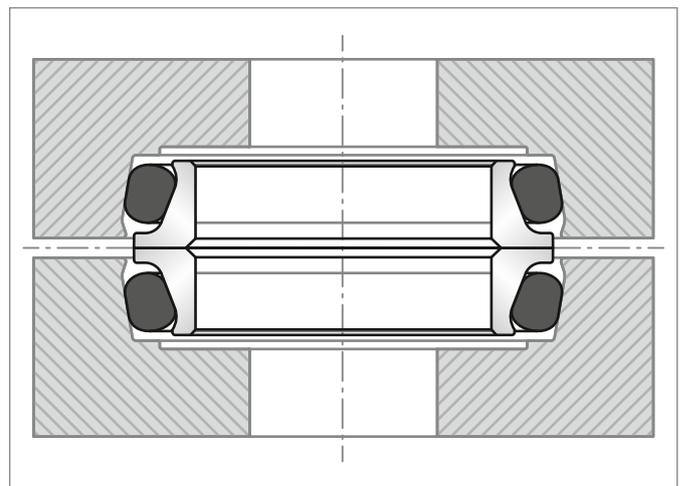

The following picture shows the correct installation of each half seal into the housing:

- Clean both lapped surfaces with a small amount of denatured alcohol and wait for it to evaporate. Apply a thin film of clean oil to the faces.
- Tilt the two parts together, bringing the slide faces carefully into contact.
- Adjust the gap S via a slow assembly speed (for example, 2 mm/sec).
- Fill the housing with oil, and bleed if necessary.

The following picture shows correct assembly:

The following pictures show incorrect installation:

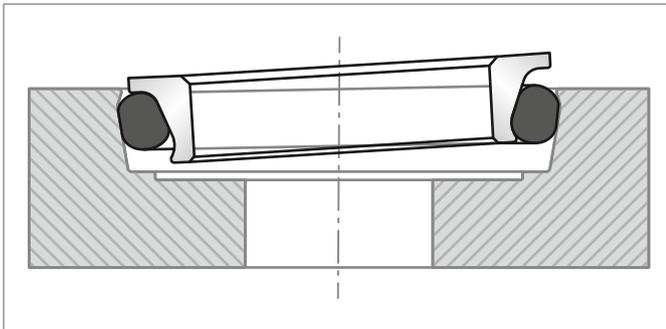

Figure 184: Metal ring slipped against the O-Ring

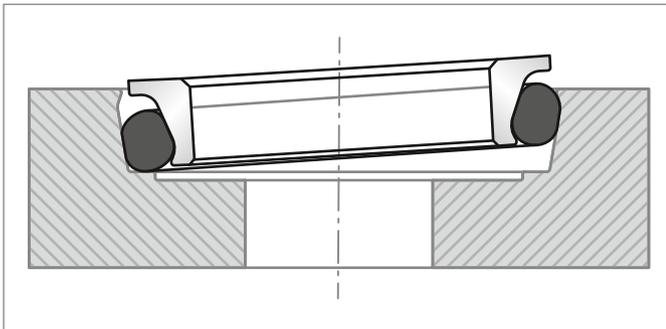

Figure 185: O-Ring slipped against the seat

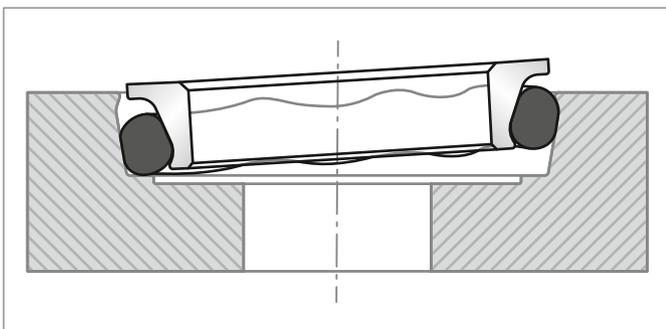

Figure 186: O-Ring slipped against the seat and wavy against the metal ring

The following pictures show incorrect assemblies:

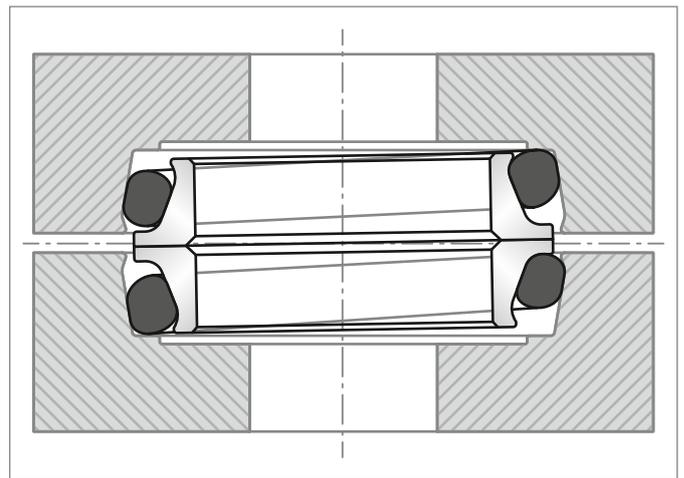

Figure 187: O-Rings slipped against seats and Mechanical Face Seal group is tilted

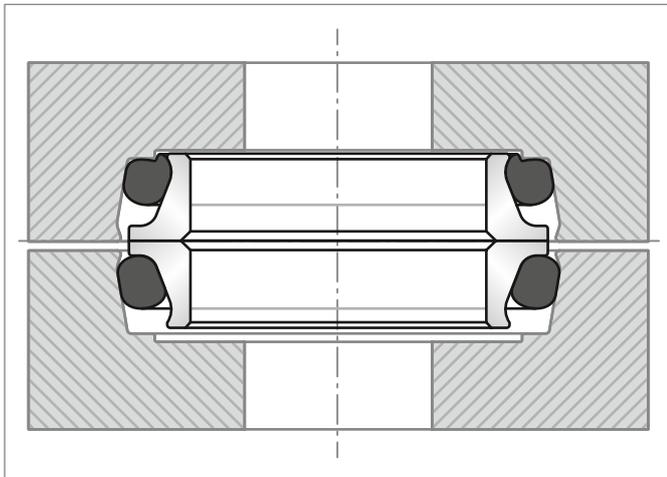

Figure 188: Upper half of the Mechanical Face Seal group has O-Ring slipped against the seat and on the seat bottom

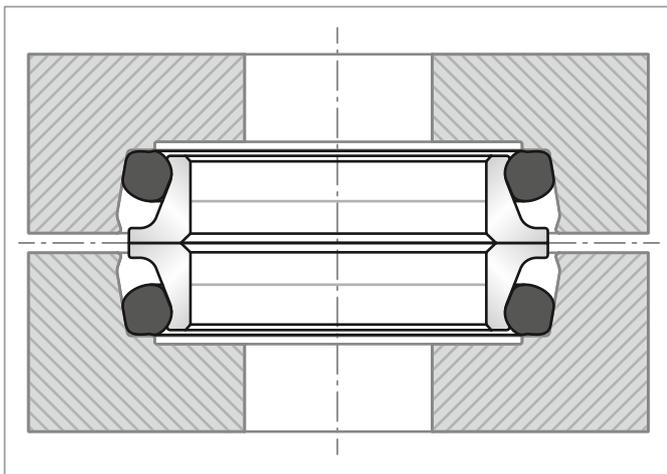

Figure 189: Both halves of the Mechanical Face Seal group have O-Rings slipped against the seat and on the seat bottom

In the event that the installation tool cannot be withdrawn or where the seal is of a special design, an installation O-Ring can be used. The installation O-Ring is placed between the O-Ring of the seal and rear of the ramp on the seal ring. As force is applied, using a tool (Figure 190) that touches the inner part of the metal ring close to the inner diameter and far from related lapped surfaces, to the seal ring during installation, the installation O-Ring backs up the O-Ring and will not allow it to roll up the ramp. After installation the O-Ring is easily removed (see Figure 190).

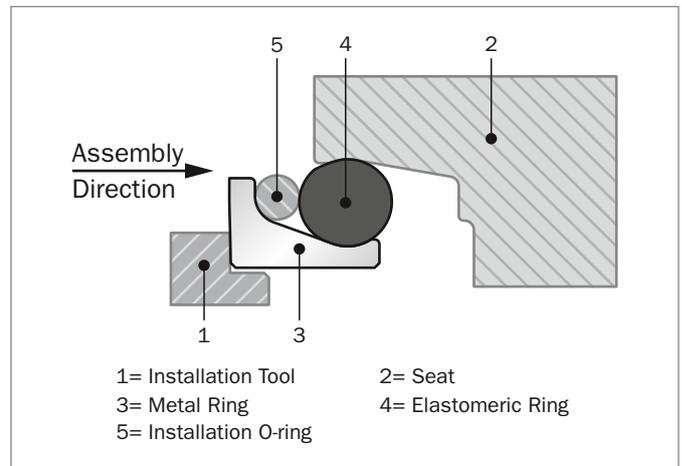

Figure 190: O-Ring as installation aid

INSTALLATION INSTRUCTIONS FOR THE TYPE DF

- Make sure that the Diamond-Shape Elastomeric Ring is well assembled on the metal ring.
- Clean the half seal groups in volatile solvent or industrial denaturated alcohol and wait for it to evaporate, being sure that no oil film remains on the parts.
- Assemble each half on the seal into the house using an installation tool (Figure 191). Use a uniform load over the tool to push the half group in to the housing until the elastomeric ring reaches the house bottom. The installation tool has to only touch the inner part of the metal ring close to the Inner Diameter and far from the lapped surfaces.
- If you have any doubts or suggestions, please contact your local Trelleborg Sealing Solutions marketing company.
- Remove the tool and make a visual check of the position of the seal. Make sure that everything is seated symmetrically.
- Clean both lapped surfaces with a small quantity of denaturated alcohol and wait for it to evaporate. Then, apply a thin film of clean oil to the faces.
- Tilt the two parts together, bringing the slide faces carefully into contact.
- Adjust the gap S via a slow assembly speed (2 mm/sec e.g.).

ORDERING EXAMPLE

Mechanical Face Seal Type DF in Bearing Steel

Inside diameter: Di = 150 mm

Materials: Sealing Ring of Bearing Steel
Square Ring of NBR

General Quality Criteria and Storage Guidelines

■ General Quality Criteria

The cost-effective use of seals and bearings is highly influenced by the quality criteria applied in production. Seals and bearings from Trelleborg Sealing Solutions are continuously monitored according to strict quality standards from material acquisition through to delivery.

Certification of our production plants in accordance with international standards including ISO 9001, IATF 16949, EN/AS 9100, ISO 13485, ISO 14001, OHSAS 18001 or ISO 29001 meets the specific requirements of the quality management system.

Our quality policy is consistently controlled by strict procedures and guidelines which are implemented within all strategic areas of the company.

All testing of materials and products is performed in accordance with accepted test standards and specifications, e.g. random sample testing in accordance with ISO 2859-1 AQL 1.0 general inspection level II, normal inspection.

Inspection specifications correspond to standards applicable to individual product groups (e.g. for O-Rings: ISO 3601).

Our sealing materials are produced free of chlorofluorinated hydrocarbons and carcinogenic elements.

■ Guidelines for the Storage of Polymer Products Based on ISO 2230

Many polymer products and components are stored for long periods of time before being put into service, so it is important they are stored in conditions that minimize unwanted changes in properties. Such changes may result from degradation, in which case they may include excessive hardening, softening, cracking, crazing and other surface effects. Other changes may be caused by deformation, contamination or mechanical damage.

Packaging

Unless otherwise specified in the appropriate product specification, rubber products should be enclosed in individual sealed envelopes. The packaging should be carried out in an atmosphere in which the relative humidity is less than 70%, or if polyurethanes are being packed, less than 65%. Where there is serious risk of ingress of moisture (e.g. rubber-metal-bonded parts), aluminum foil/paper/polyethylene laminate or other similar means of protection should be used to ensure protection from ingress of moisture.

Temperature

The preferred storage temperature for elastomer parts is +15 °C (+59 °F) and should not exceed +25 °C (+77 °F). The products should be stored away from direct sources of heat such as boilers, radiators and direct sunlight. If the storage temperature is below +15 °C (+59 °F), care should be exercised during handling of stored products, as they may have stiffened and have become susceptible to distortion if not handled carefully.

Humidity

The relative humidity should be such that, given in the variations of temperature in storage, condensation does not occur. In all cases, the relative humidity of the atmosphere in storage should be less than 70%, or if polyurethanes are being stored, less than 65%.

Light

Rubber should be protected from light sources, in particular direct sunlight or intense light having a high ultra-violet content. It is advisable that any windows of storage rooms be covered with a red or orange coating or screen.

Radiation

Precautions should be taken to protect stored products from all sources of ionizing radiation likely to cause damage to the products.

Ozone

Ozone has a particularly harmful effect on rubber. Storage rooms should not contain any equipment that is capable of generating ozone, such as mercury vapor lamps or high-voltage electrical equipment giving rise to electric sparks or electrical discharges. Combustion gases and organic vapors should also be excluded, as they may give rise to ozone via photo-chemical processes. When equipment such as a fork-lift truck is used to handle large rubber products, care needs to be taken to ensure this equipment is not a source of pollution that may affect the rubber. Combustion gases should be considered separately. While they are responsible for generating ground-level ozone, they may also contain unburned fuel which, by condensing on rubber products, can cause additional deterioration.

Deformation

Rubber should be stored free from tension, compressive stresses or other causes of deformation. Where products are packaged in a strain-free condition, they should be stored in their original packaging. In case of doubt, the manufacturer's advice should be sought. It is advisable that rings of large internal diameter are formed into three equal loops so as to avoid creasing or twisting. It is not possible to achieve this condition by forming just two loops.

Contact with liquids and semi-liquid materials

Rubber should not be allowed to come into contact with liquid or semi-liquid materials (for example, petrol, greases, acids, disinfectants, cleaning fluids) or their vapors at any time during storage, unless these materials are by design an integral part of the product or the manufacturer's packaging. When rubber products are received coated with their operational media, they should be stored in this condition.

Contact with metals

Certain metals and their alloys (in particular, copper and manganese) are known to have harmful effects on some rubbers. Rubber should not be stored in contact with such metals except when bonded to them. They should be protected by wrapping in, or by separation with, a suitable material, e.g. paper or polyethylene.

Contact with dusting powder

Dusting powders should only be used for the packaging of rubber items in order to prevent adhesion. In such cases, the minimum quantity of powder to prevent adhesion should be used. Any powder used should be free from any constituent that would have a harmful effect on the rubber or the subsequent application of the rubber.

Contact between different products

Contact between products made from rubbers of different compositions should be avoided. This includes products of the same type but differing in color.

Rubber-to-metal bonded products

The metal part of rubber-to-metal bonded products should not come into contact with the rubber of other products. Preservative used on the metal should be of a type that it will not adversely affect the rubber or the bond to such an extent that it does not comply with the product specification.

Storage life

This is the maximum period of time that a rubber product, appropriately packaged, may be stored. After this time the product is regarded as unserviceable for the purposes for which it was originally manufactured. The storage life of a rubber product is influenced by its shape and size as well as its composition. Thick products usually undergo slower changes through degradation than thinner ones.

Initial storage period

This is the maximum period, starting from the time of manufacture, for which a rubber product, appropriately packaged, may be stored under specified conditions before a sample needs to be inspected or re-tested.

Extension storage period

This is the period for which a rubber product, appropriately packaged, may be stored after the initial storage period, before further inspection and re-testing is necessary.

Assembly

These are products or components containing more than one element, one or more of which is made of rubber. Generally it is not recommended to store elastomeric products in an assembled condition. If it is necessary to do so, the units should be checked more often. The inspection interval depends on the design and geometry of the components.

Inspection before extension storage

Before any items are to be stored for an extension period, representative samples of each type should be selected for inspection at the end of the appropriate initial storage period. Inspection should be in accordance with the relevant product specification.

Visual inspection

Inspect each of the items for the following:

1. Permanent distortions, such as creases or flats.
2. Mechanical damage, such as cuts, tears, abraded areas or delaminated plies.
3. Surface cracking when viewed under a microscope at x10 magnification.
4. Changes in surface condition, such as hardening, softening or tackiness.

Assessment at the end of the initial period

If, following the visual inspection procedure the items are not satisfactory, they should not be stored for an extended period. If the items are satisfactory and are stored for an extended period a record should be kept of the date initial storage began as well as the date the extended storage period began. Items stored for an extended period should be inspected and tested at, or before, the expiry of the extension storage period before they are put into service or stored for a further extended period.

Table 133: Initial and extension storage periods for unassembled components

Material Group	Initial Storage Period	Extended Storage Period
AU, EU, NR, SBR	5 years	2 years
ACM, AEM, CR, ECO, HNBR, IIR, NBR	7 years	3 years
CSM, EPDM, FKM, FMQ, FVMQ	10 years	5 years
FFKM Isolast®	20 years	5 years
Zurcon®	10 years	5 years
PTFE	unlimited	

Note 1: If the storage temperature is over or under +25 °C (+77 °F) this will influence the storage time. Storage at +10 °C (+50 °F) higher will reduce the storage time by about 50%. Storage at +10 °C (+50 °F) lower will increase the storage time by around 100%.

Note 2: In application areas such as aerospace the storage periods can differ from this specification. These specific storage conditions have to be agreed between the supplier and the buyer.

Trelleborg is a world leader in engineered polymer solutions that seal, damp and protect critical applications in demanding environments. Its innovative solutions accelerate performance for customers in a sustainable way.

Trelleborg Sealing Solutions is a leading developer, manufacturer and supplier of precision seals, bearings and custom-molded polymer components. It focuses on meeting the most demanding needs of aerospace, automotive and general industrial customers with innovative solutions.
